BioOne Complete (complete.BioOne.org) is a full-text database of 200 subscribed and open-access titles in the biological, ecological, and environmental sciences published by nonprofit societies, associations, museums, institutions, and presses.

Your use of this PDF, the BioOne Complete website, and all posted and associated content indicates your acceptance of BioOne's Terms of Use, available at www.bioone.org/terms-of-use.

Usage of BioOne Complete content is strictly limited to personal, educational, and non - commercial use. Commercial inquiries or rights and permissions requests should be directed to the individual publisher as copyright holder.

BioOne sees sustainable scholarly publishing as an inherently collaborative enterprise connecting authors, nonprofit publishers, academic institutions, research libraries, and research funders in the common goal of maximizing access to critical research.

In Memoriam

Paul C. Van Deusen

1953–2015

Paul C. Van Deusen, 62, died on August 21, 2015. Paul was born June 25, 1953, in Allford, Massachusetts. Growing up, Paul enjoyed school, especially math, which became a part of his life's work. Paul earned a BS degree in forest management from the University of Massachusetts in 1975, a Master's degree in forest biometrics from Mississippi State University in 1979, and a PhD in forest biometrics from the University of California, Berkeley, in 1984. He also served two years in the Peace Corps in Jamaica, assisting in forestry work with land surveying, inventorying natural forests, and preparing management plans.

Paul was a principal research scientist with the National Council for Air and Stream Improvement (NCASI), working with the Statistics and Model Development Group on forest inventory and analysis methods. He also developed and maintained a suite of online tools to facilitate spatially explicit forest-harvest scheduling, visualizing and analyzing forest inventory and analysis (FIA) data, estimating forest carbon, and analyzing wildlife habitat selection. Paul authored many publications on such topics as the design of field methods for forest inventory, methods for analyzing forest inventory data, economic effects of constraints on forest

management, and wildlife habitat selection. He also worked in forest biometrics for Mississippi State University and with the US Forest Service as a mathematical statistician and project leader for the Southern Research Station's Institute for Quantitative Studies.

Paul's contribution in dendrochronology was principally in quantitative methods, capitalizing on his life-long love of, and aptitude with, math. Of some 20 + scientific articles of his in tree-ring science published in the 1980s and 1990s, titles include "Model-based approach to tree ring analysis," "Evaluating time-dependent tree ring and climate relationships," "Trend monitoring with vary-

ing coefficient models," "Frequency domain tree-ring standardization," "Applications of the Kalman Filter to tree-ring analysis," and "Bayesian procedures for reconstructing past climate." Additionally, Paul's research focused on forest decline, especially of red spruce stands of North America, with such titles as "Synchronic large-scale disturbances and red spruce growth decline," "Spatial and temporal variation in . . . growth decline in red spruce," "Stand dynamics and red spruce decline," and "Possible red spruce decline: Contributions of tree-ring analysis."
