BioOne Complete (complete.BioOne.org) is a full-text database of 200 subscribed and open-access titles in the biological, ecological, and environmental sciences published by nonprofit societies, associations, museums, institutions, and presses.

Your use of this PDF, the BioOne Complete website, and all posted and associated content indicates your acceptance of BioOne's Terms of Use, available at www.bioone.org/terms-of-use.

Usage of BioOne Complete content is strictly limited to personal, educational, and non - commercial use. Commercial inquiries or rights and permissions requests should be directed to the individual publisher as copyright holder.

BioOne sees sustainable scholarly publishing as an inherently collaborative enterprise connecting authors, nonprofit publishers, academic institutions, research libraries, and research funders in the common goal of maximizing access to critical research.

TRYPANOSOMES OF SMALL MAMMALS IN IRAN

GH. H. EDRISSIAN, A. FARHANG-AZAD and V. M. NERONOV,
Department of Medical Parasitology and Mycology, School of Public Health and
Institute of Public Health Research, University of Teheran, P.O. Box 1310, Teheran, Iran

Abstract: Trypanosomes in the subgenera *Herpetosoma*, *Schizotrypanum* and *Megatrypanum* were found in 31 small mammals representing nine species of the orders *Rodentia*, *Insectivora* and *Chiroptera* in Iran.

CASE REPORT

In a "Survey of Small Mammal-Borne Disease" carried out by the Iran-WHO International Epidemiological Research Center during 1969-1970 in Iran, 4620 animals belonging to 70 different species were caught in different parts of the country. Altogether, 14,789 smears were prepared from the blood (thick and thin smears), spleen, liver, kidney, lung and bone marrow, and from ear scrapings of some of the animals. Smears were stained by the standard Giemsa technique and examined microscopically using magnifications of 600X or 1000X.

In the orders *Rodentia*, *Insectivora* and *Chiroptera*, 31 animals belonging to 9 different species were infected with trypanosomes of the subgenera *Herpetosoma*, *Schizotrypanum* and *Megatrypanum*. The species identification of the trypanosomes are that given by Hoare:³

1. Subgenus *Herpetosoma*: *T. (H.) ulanovi* in 10 from 53 *Allactaga wilhamsi*; *T. (H.) bandicotti* in 2/45 *Nesokia indica* and one *Trypanosoma* sp. of this subgenus in 1/766 *Meriones persicus* with no apparently previous record. *T. (H.) crocidurae* in 3/24 *Crocidura russula* and *Crocidura* SP.

2. Subgenus *Schizotrypanum*: *T. (S.) vespertilionis* in 2/7 *Eptesicus ognevi* and 6/54 *Myotis blythi*. *T. (S.) vespertilionis* or *T. (S.) pipistrelli* in 2/92 *Pipistrellus pipistrellus*. The only way to distinguish the species *T. (S.) vespertilionis* from *T. (S.) pipistrelli* [as *T. (S.) dionisii*] is by the morphology in culture or DNA buoyant density^{1,2} which was not done in this study.

3. Subgenus *Megatrypanum*: *T. (M.) megadermae* in 1/20 *Rhinolopus hipposiderus* and 4 *Trypanosoma* spp. of this subgenus in 89 *Miniopterus schreibersi* with no previous record.

Acknowledgements

We are extremely grateful to Dr. Arata and the field members of the Iran-WHO International Epidemiological Research Center and to our colleagues, especially Mr. A. Afshar, and Mr. N. Assad, in the protozoology unit for their valuable collaboration in this survey, we would also like to thank Dr. J. Baker, Meltano Institute, University of Cambridge, who kindly checked the identification of trypanosomes, as well as Dr. A. Nadim for his encouraging help and guidance.
