BioOne Complete (complete.BioOne.org) is a full-text database of 200 subscribed and open-access titles in the biological, ecological, and environmental sciences published by nonprofit societies, associations, museums, institutions, and presses.

Your use of this PDF, the BioOne Complete website, and all posted and associated content indicates your acceptance of BioOne's Terms of Use, available at www.bioone.org/terms-of-use.

Usage of BioOne Complete content is strictly limited to personal, educational, and non-commercial use. Commercial inquiries or rights and permissions requests should be directed to the individual publisher as copyright holder.

BioOne sees sustainable scholarly publishing as an inherently collaborative enterprise connecting authors, nonprofit publishers, academic institutions, research libraries, and research funders in the common goal of maximizing access to critical research.

Preservation of Arctic dinosaur remains from the Prince Creek Formation (Alaska, USA): A reply to Fiorillo (2016)

HIROTSUGU MORI, PATRICK S. DRUCKENMILLER, and GREGORY M. ERICKSON

We thank Anthony Fiorillo (2016) for the concerns he raised regarding our characterizations of the Liscomb bonebed fossils in our paper describing *Ugrunaaluk kuukpikensis* from the Prince Creek Formation of Alaska, USA (Mori et al. 2016). We did not imply that the bones are not “fossilized”. The bones are from animals that lived in the geologic past (~70 million years old) and are therefore fossils by definition. In our generalized description of bone preservation, we used the modifier “typically” in describing the degree to which bones are uncrushed and permineralized. We did not contend that bones are never uncrushed or permineralized. We recognize that the bones are ferruginous in color reflecting some degree of iron-bearing mineral infiltration, which technically can be categorized as permineralized. However, vertebrate paleontologists typically reserve this term for cases where mineral infiltration lines the vascular canals and trabecular spaces of bones and is visible macroscopically. We are aware that some bones in the Liscomb Bonebed exhibit this type of preservation, but maintain that it occurs in a surprisingly small, currently unquantified percentage of bones. We apologize for any confusion this may have caused. Finally, in

supporting our general diagenetic comments about the Liscomb Bonebed, we cited the comprehensive works by Gangloff and Fiorillo (2010) and Fiorillo et al. (2010)—the two most relevant works on the subject. These would have been glaring omissions had we not done so.
