Abstract—*Phymaspermum*, the largest and most complex genus within the subtribe Phymasperminae, is revised and 17 species are recognised, all endemic to southern Africa. Four new species are described (*P. aphylum*, *P. comptonii*, *P. oppositifolium*, and *P. trifidum*), five species are reduced into synonymy (*P. bolissii*, *P. equisetoides*, *P. montanum*, *P. pubescens*, and *P. villosum*), and *P. thymelaeoides* is recognised as the oldest available epithet for *P. Schroteri*. The species of *Phymaspermum* can be distinguished by a combination of habit, leaf, involucral, and fruit characters. Species relationships are assessed in a cladistic analysis of 12 anatomical and morphological characters. *Phymaspermum* is distinguished from *Eumorphia* and *Gymnopentzia* by the unique stalked myxogenic trichomes on the fruit surface. This character is shown to be a synapomorphy for *Phymaspermum* although subsequently lost in two species and replaced by resin canals in the fruit ribs. A comprehensive taxonomic treatment is presented, including a key to the species, correct nomenclature, typification, descriptions, and geographical distributions.

Keywords—Cladistic analysis, *Eumorphia*, fruit anatomy, *Gymnopentzia*, morphology, myxogenic trichomes, new species.

*Phymaspermum* Less. is the largest genus within the subtribe Phymasperminae with 18 species previously recognised, all endemic to southern Africa (Germishuizen et al. 2006). The genus was described by Lessing (1832) for a single species (*P. junceum*) and later expanded by Källersjö (1986) to include species which had previously been placed within other genera such as *Athanasia* L., *Brachymeris* DC., and *Pentzia* Thunb. Several of the species are now well grazed by livestock (Shearing and Van Heerden 1994; Vlok and Schutte-Vlok 2010; Schutte-Vlok pers. comm.). In particular, the vernacular name of *P. parvifolium*, “good karoo,” alludes to its importance as a pasture plant for Merino sheep (Harvey 1864). *Phymaspermum acerosum* is also used in Zulu culture as a charm to ward off pasture plant for Merino sheep (Harvey 1864). *Phymaspermum acerosum*) lack the diagnostic myxogenic ovoid trichomes on the cypselas, leading her to remark that these species may need to be recognised as a separate genus. A cladistic analysis of morphological characters in the subtribe is explored to assess the monophyly of *Phymaspermum* and possible infrageneric relationships.

A taxonomic revision of *Phymaspermum* is presented, including comprehensive descriptions, a key to the species, nomenclature, typification, diagnostic characters with illustrations and distribution data.

Materials and Methods

Most of the species were studied in situ and all were studied from selected specimens from B (digital images), NBG, NU, and PRE, as well as the entire collections of BOL, SAM, and WIND (digital images). Maps of each species were produced according to validated information provided on the associated herbarium labels. Collecting localities and associated grid references were checked in literature (Leistner and Morris 1976). They were plotted according to the degree reference system as described by Leistner and Morris (1976). The specimens examined are cited under each species treatment and arranged by country, province and then district, and ordered according to geographical position, from west to east and north to south. The quarter degree and associated district are indicated in bold.

Cypsela material was fixed in formalin-acetic acid-alcohol (FAA) for at least 24 hr. Herbarium material was first rehydrated at 60°C for two days before being fixed. Whole cypselas were embedded in glycol methacrylate (GMA) according to a modification (a five day final infiltration) of the method described in Feder and O’Brien (1968). They were then stained using the periodic acid-Schiff/toluidine blue (PAS/TB) method of Feder and O’Brien (1968). All sections were viewed under a...
Leitz wetlzar light microscope and photographed with a JVC KY-F1030 digital camera with AcQuis digital imaging software version 4.0.1.7. Cypsela surface structure was also studied using a scanning electron microscope (SEM). Cypsels were mounted on copper stubs and gold coated using an Emscope gold coater. These were then viewed in a microscope (SEM). Cypselas were mounted on copper stubs and gold coated using an Emscope gold coater. These were then viewed in a microscope (SEM).

To construct a phylogeny of Phymaspernum and its relationship to the other two genera within Phymaspermminae, Eumorphia and Gymnopsis, 12 vegetative and reproductive characters for 24 taxa within the tribe were scored (Table 1; Appendix 1) using the outgroup comparison method, with a species of Athanasia (A. eliae Källersjö) as outgroup (Källersjö 1991). We selected a member from the subtribe Athanasiinae in the capitula are axillary and subsessile. The multistemmed species are all corymbose, except for E. prostrata, which are usually terminal and more or less solitary or aggregated into corymb (Fig. 1A–D). In P. scoparium, however, the capitula are axillary and subsessile. The multistemmed species are all corymbose, except for P. aciculare, P. erubescens, and P. pinnatifidum. In the latter three discoid species and all the radiate species, the capitula are either solitary on the peduncles or with one to three additional capitula borne from leaf axils below (Fig. 1E, H–J). The capitula of P. appressum (Fig. 1I, J) and P. oppositifolium appear to be borne on short axillary fascicles due to their indistinct peduncles.

Most Phymaspernum species have up to four series of involucral bracts, although there can be up to five series in P. athanasioides or six series in P. woodii. The bracts are usually tightly arranged in an imbricate manner and have conspicuous longitudinal resin ducts. In P. acerosum, P. comptonii, and P. pinnatifidum, however, the bracts are irregularly arranged and the number of series are more difficult to distinguish. The involucral bracts of Phymaspernum species are generally rigid with membranous apices and edges, but in P. appressum and P. oppositifolium, the bracts become scarious and brittle. All Phymaspernum species have membranous apices especially on the innermost bracts. The margins of the involucral bracts are prominently dark brown in P. argenteum and sometimes light brown or indistinct in P. woodii and P. leptomorphum. The involucral bracts of P. comptonii have a prominent brown midrib. A brown midrib can also be seen in P. pinnatifidum due to the large bulging resin canal. These bulging resin canals also give the outer bracts a distinctive curved appearance. The involucral bracts can also be hairy or glabrous and have scarious apices and margins. Phymaspernum thymelaeoides has silvery villous involucral bracts which are bronze in P. peglerae. Other species such as P. comptonii, P. scoparium, and P. trifidum have silvery pubescent involucral bracts. The rest of the species generally have glabrous involucral bracts.

Results and Discussion

Morphology and Anatomy—Vegetative Characters—All species of Phymaspernum are evergreen, perennial shrubs or shrublets and fall into two main growth forms: (1) Multi-stemmed subshrubs with woody rootstock and virgate unbranched or poorly branched stems (P. acerosum, P. aciculare, P. argenteum, P. athanasioides, P. comptonii, P. erubescens, P. peglerae, P. pinnatifidum, and P. woodii, Fig. 1A–E) or (2) single-stemmed, well branched shrubs or shrublets (P. aphyllum, P. appressum, P. leptomorphum, P. oppositifolium, P. parvifolium, P. scoparium, P. thymelaeoides, and P. trifidum, Fig. 1F–N, where the branch apices of P. aphyllum (Fig. 1M) and P. scoparium are often spine tipped).

The indumentum ranges from glabrous to densely hairy, although in P. argenteum, P. comptonii, P. thymelaeoides and P. trifidum (Fig. 1F–H) it is conspicuously densely sericeous. Phymaspernum aciculare, P. erubescens and P. peglerae are readily distinguished from one another by their indumenta, i.e. glabrous in P. aciculare, silvery villous or hispid in P. erubescens and bronze villous in P. peglerae.

With the exception of the new species, P. oppositifolium, all the species of Phymaspernum have sessile, alternate leaves. Most of the species have spreading or erect leaves, except in P. appressum (Fig. 1I, J) and P. oppositifolium where they are characteristically closely appressed. Phymaspernum aphyllum is the only species which has characteristically very few and reduced leaves (Fig. 1M, N). The leaves are usually pinnatisect to trifid. Invariably simple entire leaves are diagnostic for P. aphyllum, P. appressum, P. oppositifolium, and P. scoparium. In P. leptomorphum and P. thymelaeoides, the leaves are usually simple and entire, rarely lobed. The leaves of P. appressum and P. oppositifolium are characteristically very bony, becoming scarious along the peduncles, while in the rest of the genus they are either fleshy or leathery.

Reproductive Characters—The capitula of Phymaspernum are usually terminal and more or less solitary or aggregated into corymb (Fig. 1A–D). In P. scoparium, however, the capitula are axillary and subsessile. The multistemmed species are all corymbose, except for P. aciculare, P. erubescens, and P. pinnatifidum. In the latter three discoid species and all the radiate species, the capitula are either solitary on the peduncles or with one to three additional capitula borne from leaf axils below (Fig. 1E, H–N). The capitula of P. appressum (Fig. 1I, J) and P. oppositifolium appear to be borne on short axillary fascicles due to their indistinct peduncles.

Phylogenetic analyses were conducted using the parsimony algorithm of the software package PAUP* for Windows version 4.08 (Swofford 1998) with the PaupUp graphical interface (Calendini and Martin 2005). Characters were equally weighted (Wagner parsimony, Farris 1970) and optimized with both accelerated transformation (ACCTRAN) and delayed transformation (DELMTRAN) with no difference between the two. Tree searches were performed using a heuristic search with 1,000 random sequence additions, tree bisec-

Table 1. Taxon by character matrix used for the morphological and anatomical phylogenetic analyses. See Appendix I for a description of characters and character states.
As also found in Gymnopentzia, paleae of Phymaspermum species are restricted to the margins and are usually in one series, but sometimes in two series as in P. woodii. However, we have sometimes observed rudimentary paleae in the centre of the receptacles in P. acerosum and P. thymelaeoides. Unlike involucral bracts which usually only have scarios margins and apices, most paleae are scarios and sometimes have ciliate margins (P. acerosum) and apices with reduced longitudinal resin canals. The shape and size of these paleae are variable within species.

The capitula are largely either radiate or discoid, although in one species, P. athanasioides, they are disciform. This character is constant for all the species except P. aciculare, where plants can have either discoid or sometimes radiate capitula. When ray florets are present in this species, however, they are very few and reduced in size.

The ray florets are pistillate and fertile, with a white to cream limb which may sometimes have a purplish tinge near the base or underside; in P. appressum and P. oppositifolium they are often entirely purplish. The limbs are usually ovate to obovate and apically three-toothed, although in P. aciculare they are obovate.

The disc florets are bisexual and five-lobed. The tube is usually readily distinguishable from the limb and equal in length, although in P. athanasioides and P. woodii, the tube can be longer than the limb, and in P. appressum and P. oppositifolium the distinction between the tube and the limb is not clear. The corollas are always somewhat glandular, but pilose hairs can be found in P. scoparium and P. thymelaeoides. The lobes are triangular and usually spreading, except in P. appressum and P. oppositifolium where they are erect. Similarly erect lobes are sometimes also observed in P. athanasioides. Resin canals in the lobes of the disc florets are absent in all species except in P. acerosum, which rarely has red resin ducts in the tube, limb, and lobes. The anthers of all species have a more or less sagittate base and the appendages were not found to be taxonomically useful.

The cypselas are ellipsoid or obovoid and usually prominently 10–14 ribbed, except in P. leptophyllum where ribs are not prominent (Fig. 2D, L). The fruits are usually 1.6–2.5 mm long and 0.5–0.7 mm wide, although in three species, P. aciculare, P. erubescentes (Fig. 2E), and P. peglerae, they are prominently larger, being more than 2.5 mm long (up to 3.5 mm) and 1.0 mm wide. The fruits of P. pinnatifidum can also be up to 3.5 mm long (Fig. 2F) but they are never as wide as those of P. aciculare, P. erubescentes, and P. peglerae. A pappus is lacking in all the species, although there may be a thickened apical rim on the cypselas. Phymaspermum pinnatifidum is unique in that it has a conspicuous and extended membranous apical rim (Figs. 2F). The cypselas of Phymaspermum are unique in that they have ovoid, stalked myxogenic trichomes (Fig. 2A–E, 1, L, M), a synapomorphy for the genus. These stalked myxogenic trichomes are white when dry with an ovoid head consisting of a few cells (Fig. 2I, L, M). Phymaspermum is the only genus within Anthemideae with these stalked trichomes on the cypselas rather than the more usual myxogenic epidermal cells. Only those trichomes on the fruits of the radiate species were observed to rupture (Fig. 2L) when in contact with water. In the discoid species no evidence of rupturing was observed (Fig. 2I, M). These stalked trichomes are particularly dense on the cypselas of the radiate species (Fig. 2B–D). The stalked trichomes are more sparse on the discoid species and can sometimes even be completely lacking in some individuals (Fig. 2E, H, M, N). However, in P. acerosum (Fig. 2G, J, K) and P. pinnatifidum (Fig. 2F) the stalked trichomes have been consistently lost.

In transverse section the epidermal cells are usually more anticlinally elongated in the radiate species of Phymaspermum. In P. leptophyllum (Fig. 2L), these cells are much more distinct and uniform and unlike the other species where they are shorter and distinctly papillate. The cypsela ribs of P. leptophyllum are therefore not as distinct as those in other species. The stalks of the myxogenic trichomes are embedded between these cells and as a result appear sessile. These distinct epidermal cells of P. leptophyllum allow this species to be distinguished from other closely related species such as P. aphyllum and P. thymelaeoides.

The testa epidermis and endocarpic cells remain parenchymatous but in some species they become sclerified. In the mesocarp, the sclerenchyma of Phymaspermum is organised into discrete bundles in which the vascular tissue is found (Fig. 2I–N). The endocarp is seen as a single layer of cells with dark staining contents (Fig. 2I–N).

In three species, resin canals were observed in the cypselas ribs, viz. P. acerosum (Fig. 2J, K), P. comptonii (Fig. 2I), and P. pinnatifidum. The presence of a resin canal in the cypselas of P. comptonii is significant, as it is the only species that combines both resin canals and myxogenic trichomes.

**Phylogenetic Relationships**—Of the 12 scored characters, 10 were parsimony-informative and two parsimony-uninformative. Two equally parsimonious trees were obtained (differing only in the placement of P. scoparium — either sister to the radiate clade or unresolved) with a tree length (TL) of 17 steps, a consistency index (CI) value of 0.71 and a retention index (RI) value of 0.9. The strict consensus tree is presented in Fig. 3.

Eumorphia and Phymaspermum are recovered to be monophyletic although without bootstrap support and the monotypic Gymnopentzia is not embedded within either Eumorphia or Phymaspermum. Despite the shared presence of opposite leaves, Eumorphia and Gymnopentzia were not recovered as sister genera. Rather, Gymnopentzia was placed sister to Phymaspermum based on the synapomorphous loss of receptacular paleae (character 4). This sister relationship between Gymnopentzia and Phymaspermum was also recognised by Bremer and Humphries (1993) in an alternative equally parsimonious cladogram. Phymaspermum is recovered as monophyletic, supported by the presence of myxogenic trichomes on the cypselas (character 10) (secondarily lost in P. acerosum and P. pinnatifidum). Within Phymaspermum three lineages are identified, although their relationships to one another are unresolved. The first comprises the anomalous P. scoparium, the second a clade of radiate (character 6), single-stemmed species and the third a clade of multistemmed (character 1), largely discoid species (sometimes sparsely radiate in P. aciculare) with sparsely glandular fruits (character 11). Within the discoid clade, P. aciculare, P. erubescentes, and P. peglerae form a sister group (BP 67) to the rest of the species based on their larger fruits (character 7) and a subclade comprising P. acerosum – P. woodii is recovered based on the corymbose synflorescence structure (character 3). Within the latter subclade the presence of resin canals in the fruits (character 12) group P. acerosum, P. comptonii, and P. pinnatifidum together. Resolution within the radiate clade is largely unresolved, except for the obvious sister

relationship between *P. appressum* and *P. oppositifolium* (BP 90), based on the closely appressed leaves (character 2) and scarious bracts (character 5).

**Taxonomic Treatment**

Evergreen, single- to multistemmed, very sparsely to densely leafy, shrubs or subshrublets, 0.2–2.0 m high. Stems unbranched to much-branched; branches erect or spreading, rarely spine-tipped, strigate, glabrous to densely matted; fascicles usually present in leaf axils, sometimes becoming woolly (in *P. acerosum* and *P. woodii*). Leaves sessile, alternate or rarely opposite (*P. oppositifolium*), very sparsely to closely imbricate, appressed to spreading, 1.0–40.0 × 0.2–3.0 mm, linear to spathulate, entire to pinnatifid, margins involute to revolute, sometimes narrowed into petiole-like base with secondary basal lobes, glabrous to villous, bony, leathery or fleshy; basal swelling continuous with stem ribs present; lobes 0–9, 0.2–24.0 × 0.5–1.5 mm, linear, mucronate to attenuate. Capitula homogamous or heterogamous, radiate, disciform or discoid, terminal or on very short axillary shoots, solitary, with 0–3 additional capitula from leaf axils below or in few- to many-headed (3 to >100), simple or compound corymbs, pedunculate or rarely subsessile; peduncles 1.0–95.0 mm long, glabrous to densely matted. Involucre cylindrical or urceolate to campanulate or hemispherical, sometimes tapering at the base; involucral bracts 3- to 7-seriate, loosely or tightly arranged, 1.0–7.0 mm long, ovate to linear, obtuse to attenuate, margins and apices scarious (bracts entirely scarious in *P. appressum* and *P. oppositifolium*), inner bracts with membranous apices 0.3–2.5 mm long, glabrous to densely villous, green to dark brown, purple, sometimes with brown margins, median resin canals present. Receptacle flat to convex, alveolate, paleate; paleae in marginal series (rarely rudimentary inner paleae canals present). Disc florets 3 to >100, bisexual, without resin canals, apices scarious or margins and apices scarious. Ray florets (when present) 3–22, pistillate; tube 1.0–4.2 mm long, sessile glandular trichomes present; limb 3.0–12.0 × 1.8–4.3 mm, ovate to obovate, usually apically 3-dentate, rarely 2-dentate or entire, white to purple. Filiform florets (only in *P. athanasioides*) ± 20, pistillate; corolla 2.3–3.0 mm long, yellow, with sessile glandular trichomes, zygomorphic; glabrous or rarely pilose, yellow to purple; tube 0.7–2.6 mm long; limb 0.5–1.8 mm long (excluding lobes), very narrowly to broadly campanulate, 5-lobed; lobes erect to spreading, 0.3–1.0 mm long, narrowly to broadly triangular or triangular ovate. Anthers 2.0–4.3 mm long (including apical appendage), sagitate at base; apical appendages lanceolate to rounded. Style 1.7–4.0 mm long (excluding the two terminally stigmatic branches), terete with thickened base; branches 0.1–1.9 mm long, truncate, with dorsal papillae. Cypselas 1.6–3.5 ×0.5–1.0 mm,
oblong to broadly obovoid, shortly papillate, apical rim absent or thickened to membranous, conspicuously or inconspicuously (in *P. leptophyllum*) 10–14-ribbed, stalked glandular trichomes present or rarely absent, usually mucilaginous, discontinuous resin canals in ribs rarely present (in *P. acerosum*, *P. comptonii*, and *P. pinnatifidum*).

**Diagnostic Characters**—*Phymaspermum* shares the papilllose, many ribbed (≥ 10) cypselas with *Eumorphia* and *Gymnopentzia* but can be distinguished by the alternate leaves (except in one species, *P. oppositifolium*) and the presence of unique stalked myxogenic trichomes on the cypselas (subsequently lost in two species, *P. acerosum* and *P. pinnatifidum*). It can be further distinguished from *Eumorphia* by the absence of inner paleae (inner paleae present in *Eumorphia*) and from *Gymnopentzia* by the shortly papilllose cypselas (long papillate cypselas in *Gymnopentzia*).

**Distribution and Ecology**—*Phymaspermum* is largely restricted to southern Africa, with one species extending into Zimbabwe. Six of the species are endemic to the Greater Cape Floristic region.

**KEY TO THE SPECIES OF PHYMASPERMUM**

1. Capitula in prominent corymbs ........................................... 2
2. Capitula heterogamous with filiform outer florets; primary leaves mostly entire, some 2- or 3-fid ........................................... 12. *P. athanasioides*
3. Capitula homogamous; primary leaves mostly trifid to pinnate .............................................................................. 3
4. Involutral bracts closely appressed, deltoid to ovate, dorsal surface flat; fruits without resin canals ........................................... 4
5. Leaf lobes ≥ 1 mm wide, usually silvery sericeous; involucre apically spreading, bracts with prominent brown margins; restricted to KwaZulu-Natal and Eastern Cape ................. 13. *P. woodi*
6. Leaf lobes ≥ 1 mm wide, usually silvery sericeous; involucre apically spreading, bracts with prominent dark brown margins; restricted to Limpopo and Mpumalanga .... 14. *P. argentatum*
7. Stems not longitudinally white-striped, hairs scattered along stem; leaves not sparse or caducous, ±0.5 mm wide, usually sparsely villous; involucre densely brown villous; ... 15. *P. comptonii*
8. Stems not longitudinally white-striped, hairs scattered along stem; leaves not sparse or caducous, ±1.0–2.0 mm wide; peduncles not becoming spinescent, fruits with distinctly ribbed and myxogenic trichomes apparently sessile ........................................... 5. *P. leptophyllum*
9. Stems not longitudinally white-striped, densely white woolly between ribs; leaves sparse, caducous, ±0.5 mm wide; peduncles often become spineose; fruits with distinct ribs and obviously stalked myxogenic trichomes ........................................... 6. *P. aphyllum*

Single-stemmed, sparsely leafy shrublet, height unknown. Stem much-branched; branches erect to spreading, spine-tipped, silvery-pubescent; fascicles sometimes present in leaf axils. Leaves alternate, appressed to spreading, 1.0–5.0 × 1.0–2.0 mm, triangular ovate to spathulate, rounded to mucronate, entire, narrowed into petiole-like base, without secondary basal lobes, densely silvery pubescent on both surfaces, fleshy; basal swelling present, continuous with stem ribs. Capitula discoid, homogenous, on short axillary shoots, solitary, subsessile. Involucre 4.0 × 3.0 mm, cyathiform, tapering at the base; involucral bracts 4-seriate, tightly arranged, margins and apices scarious, membranous apices of all bracts 0.1–0.2 mm long, glabrous to villous along edges, brown margins absent, median resin canals present; outer bracts deltoid to lanceolate, ca. 1.5 mm long, acute to obtuse; middle bracts deltoid to lanceolate, ca. 1.8 mm long, acute to obtuse; inner bracts lanceolate to oblong, ca. 1.8 mm long, obtuse; innermost bracts oblong, ca. 2.2 mm long, obtuse. Receptacle convex; paleae in marginal series, linear, ca. 3.0 mm long, obtuse, rigid with scarious margins and apices, scarious apices 0.6 mm long. Disc florets ± 10, without resin canals; lobes spreading, 0.7 mm long, triangular-obovate. Anthers 2.1 mm long (including apical appendage); apical appendage oblong. Style 2.2–2.5 mm long (excluding branches); branches 0.8 mm long, Cypselas 2.0 × 0.8 mm, narrowly obovate, 11-ribbed, apical rim thickened, slightly dentate, glandular trichomes present, dense, scattered, not mucilaginous when soaked, discontinuous resin canals in ribs absent. Figure 4.

Diagnostic Characters—Phymaspermum scoparium is unlikely to be confused with any of the other discoid species. It is easily recognised by the subsessile, axillary heads, apically spinescent stems, and florets with a pilose corolla.

Distribution and Ecology—Phymaspermum scoparium is a very poorly collected species from near Graaff-Reinet in the Eastern Cape to Hanover in the Northern Cape (Fig. 4F). The species appears to favor seasonally moist sites. Flowering time is from November to March.

Additional Specimens Examined—SOUTH AFRICA. Northern Cape: 3024 (De Aar) – Roostenbergh (AC), Drège s.n. (F-image); between Colesberg and Hanover (DD), Henrici 3924 (PRE); 3124 (Hanover) – Seckelvriever, Klein Tafelberg, Winterveld (AD), Ecklon and Zeyher 127 (SAM); Noupoort (BB), Henrici 4446 (PRE). Eastern Cape: 3125 (Steynsburg) – Midddelberg (AC), Acocks 15324 (PRE); Midddelburg, Leeufontein (AC), Theron 1055 (PRE). 3224 (Graaff-Reinet) – Sneeuwberg (AA), Drège 45070 (SAM); Sneeuwberg, lowlands (AA), Drège 59179 (PRE), Drège s.n. (two images).

Single-stemmed, densely leafy shrublet, 0.15–0.4 m high. Stem strongly-branched; branches erect to spreading, glabrous to densely silvery pubescent; fascicles sometimes present in leaf axils. Leaves alternate, spreading to rarely reflexed, 3.0–15.0 × 0.8 mm, linear to oblong, mucronate, entire to trifid, sometimes narrowed into petiole-like base, sometimes with secondary basal lobes, glabrous to silvery pubescent on both surfaces, fleshy; basal swelling present, continuous with stem ribs; lobes 2 or 3, 0.2–3.0 × 0.8 mm, oblong, mucronate. Capitula radiate, heterogamous, terminal, solitary, with up to 3 additional capitula from leaf axils below, pedunculate; peduncles 5.0–45.0 mm long, glabrous to silvery pubescent. Involucre 2.5–5.0 × 2.5–6.0 mm, narrowly campanulate (rarely hemispherical), tapering at the base; involucral bracts (outermost to innermost series, from left) and single palea (far right). D. Disc floret. E. Cypselas. F. Known geographical distribution.

Vouchers: A, B, E. Theron 1055 (PRE); C, D. Ecklon and Zeyher 127 (SAM). Scale: A–B = 4 mm; C–D = 1 mm; E = 500 μm.
involucral bracts 4-seriate, tightly arranged, margins and apices scarious, membranous apices of all bracts 0.3–0.6 mm long, usually with fimbriate margins, glabrous to hairy (rarely beyond margins), brown margins absent, median resin canals present; outer bracts deltoid, 1.0–1.6 mm long, acute to attenuate; middle bracts deltoid, 1.5–1.8 mm long, acute to attenuate; inner bracts oblong, 2.2–2.5 mm long, acute to rounded; innermost bracts oblong, 2.8–3.1 mm long, acute to rounded. Receptacle convex; paleae in marginal series, oblong to linear, 2.6–3.0 mm long, rounded, rigid with scarious margins and apices, scarious apices 0.2–0.3 mm long. Ray florets ±7; tube 1.0–1.2 mm long; limb obovate, 4.5–5.3 × 2.3–3.0 mm, apically 3-dentate, white. Disc florets 10–15, without resin canals; corolla 1.6–2.2 mm long, with only glandular trichomes, yellow to purple; tube 1.0–1.2 mm long; limb campanulate, 0.6–1.0 mm long (excluding lobes); lobes spreading, 0.6–0.7 mm long, triangular. Anthers 2.3–2.8 mm long (including apical appendage); apical appendage ovate. Style 1.7–2.3 mm long (excluding branches); branches 0.5–0.6 mm long. Cypselas 2.0 × 1.0 mm, narrowly to broadly obovate, 10–14-nerved, apical rim thickened, slightly dentate, glandular trichomes present, dense, scattered, mucilaginous when soaked, discontinuous resin canals in ribs absent. Figure 5.

Diagnostic Characters—Phymaspermum parvifolium is a compact shrub, less than 0.4 m tall, with a close branching habit and radiate heads. It can sometimes be confused with *P. thymelaeoides* but can be distinguished by its compact growth (*P. thymelaeoides* is an open branched shrub, usually more than 0.8 m tall), the linear to oblong leaves (spathulate in *P. thymelaeoides*), glabrous disc florets (often hairy in *P. thymelaeoides*) and glabrous to sparsely hairy (rarely beyond margins) involucral bracts (densely villous in *P. thymelaeoides*).

Distribution and Ecology—Phymaspermum parvifolium is widely distributed in the largely arid areas of the Western Cape, Eastern Cape and Northern Cape as well as the Free State at an altitude of 300–1,500 m (Fig. 5G). Flowering is throughout the year but peaks from March to May. This species is an important fodder plant for sheep and is commonly known as the “swart karoo,” “vaal karoo,” “wit heuning karoo,” and “good karoo” (Smith 1966; Powrie 2004).

Additional Specimens Examined—SOUTH AFRICA. Freestate: 2925 (Jagersfontein: Bloemfontein, Hagesdam farm near Hagesdam (–BD), Zietsman 4070 (PRE); Fauresmith (–CB), Macquarst 94 (BOL), Hofman s.n. PRECISE LOCALITY UNKNOWN: Bonga farm, Middelburg, Bolus 14076 (BOL).

3. Phymaspermum thymelaeoides (DC.)Magee & Ruiter comb. nov. Osteospermum thymelaeoides DC., Prodr. 6: 462 (1838). —TYPE: SOUTH AFRICA. Western Cape, Beaufort West (3222): ‘Nieuwveldbergen’ [Nieuwveld mountains] (–AB), Oct 1826, Drège 6177 (holotype: G–DC-image; isotypes: P-image, two sheets). [Note: de Candolle was uncertain about the placement of this taxon in Osteospermum. Norling (1943) in his revision of Osteospermum, recognised that O. thymelaeoides was rather a species of Phymaspermum but incorrectly considered it to be synonymous with Phymaspermum parvifolium. On closer examination the specimen clearly matches P. Schroeteri with the openly branched habit and sericeous leaves and involucral bracts. As O. thymelaeoides is the older name it has priority and P. Schroeteri is therefore reduced into synonymy. This is the only specimen of this species in de Candolle’s herbarium at G–DC.]

Single-stemmed, densely leafy shrub, (0.5)0.8–1.2 m high. Stem much-branched; branches erect to spreading, silvery pubescent; fascicles sometimes present in leaf axils. Leaves alternate, erect to spreading, 5.0–30.0 × 0.8–3.0 mm, linear to spathulate, mucronate, entire to trifid, narrowed into petiole-like base, sometimes with secondary basal lobes, silvery sericeous on both surfaces, fleshy; basal swelling present, continuous with stem ribs; lobes 3, 2.0–3.0 × 1.0 mm, linear, mucronate. Capitula radiate, heterogamous, terminal, solitary, with 0–2 additional capitula from leaf axils below, pedunculate; peduncles 5.0–35.0 mm long, silvery pubescent. Involucre 4.0–7.0 × 4.0–5.0 mm, hemispherical to cyathiform, sometimes tapering at the base; involucral bracts 3- or 4-seriate, loosely to tightly arranged, margins and apices scarious, membranaceous apices of all bracts 0.1–1.0 mm long, silvery villous, brown margins absent, median resin canals present; outer bracts lanceolate, 1.5–2.1 mm long, attenuate; middle bracts lanceolate, 2.0–2.3 mm long, rounded; inner bracts oblong, 2.7–3.8 mm long, rounded; innermost bracts oblong, 3.4–4.0 mm long, rounded. Receptacle convex; paleae in marginal series (rarely rudimentary inner paleae present); oblong, 3.5–4.0 mm long, rounded, scarious. Ray florets 8–12; tube 1.2–1.6 mm long; limb obovate, 5.4–7.2 × 2.2–3.0 mm, apically 3-dentate, white to purple. Disc florets 20–30, without resin canals; corolla 1.7–2.7 mm long, with glandular trichomes and sometimes hairs on tube, yellow to purple; tube 0.7–1.8 mm long; limb campanulate, 0.5–1.0 mm long (excluding lobes); lobes spreading, 0.5–1.0 mm long, triangular. Anthers 1.7–3.8 mm long (including apical appendage); apical appendage ovate. Style 1.2–3.2 mm long (excluding branches); branches 0.4–0.5 mm long. Cypselas 2.5 × 0.7 mm, obovate, 11-ribbed, apical rim thickened, slightly denticate, glanular trichomes present, dense, mostly between ribs, mucilaginous when soaked, discontinuous resin canals in ribs absent. Figure 6.

Diagnostic Characters — Phymaspermum thymelaeoides is an openly branched shrub, more than 0.8 m tall, with radiate heads, usually hairy disc floret tubes, and entire, spathulate leaves. It can be distinguished from P. leptophyllum by the spathulate, silvery sericeous leaves and the ribbed cypselas with prominently stalked myxogenic trichomes. Similarly silvery leaves are found in P. trifidum but in P. thymelaeoides the leaves are largely entire and the innermost involucral bracts have a much shorter membranous appendage.

Distribution and Ecology— Phymaspermum thymelaeoides occurs on upper south facing slopes, at altitudes of 1,000–1,700 m, from Ghaapkop near Laingsburg along the Roggeveld and Nuweveld mountains to Molteno Pass (Fig. 6G). Flowering appears to be throughout the year. The species is well grazed (Shearing 1159, PRE; Shearing 1181, PRE; Acocks 17199, PRE) and the flowers have a prominent honey scent.

Additional Specimens Examined — SOUTH AFRICA. Northern Cape: 3221 (Merweville): Oudekloof Bo, Oukloof (–BB), Shearing 941 (PRE); Shearing 1159 (PRE); Fraserburg, Layton Vergenoeg (–BB), Acocks 29358 (PRE); Layton flats, Vilk Camp (–BB), Acocks 29358 (PRE). Western Cape: 3221 (Merweville): Nuweveld mountains, Uitspannings River Pass, 40 km NW of Merweville (–CA), Brause 3409 (BOL); Sutherland, Besemgodeberg on Komsberg escarpment (–CA), Acocks 17199 (PRE). 3222 (Beaufort West): Nieuwveld mountains (–AB), Esterhuysen 2746 (BOL); Nieuweveld mountains, next to Molteno Pass, between entrance gates to farms Highlends and Rhenosterveld (–BA), Vilk 2527 (PRE); Theekloof (–BA), Acocks 14135 (PRE). 3320 (Montagu): Boerhoeuser farm, between Ladismith and Burgersdorp (–BB), Trolle 14381 (NBG); Ghaap Kop, Laingsburg (–BA), Compton 14421 (NBG), Schroeter 18591 (BOL); Ghaap Kop, Laingsburg, Whitehill (–BA), Compton 4427 (BOL, NBG), Esterhuysen 3270 (BOL).
4. Phymaspermum trifidum Magee and Ruiters sp. nov. —

**TYPE:** SOUTH AFRICA. Western Cape, Worcester (3319): Farm Goedemoed, between Robertson and McGregor (–DD), 28 November 2012, Magee and Boatwright 512 (holotype: NBG!; isotypes: BOL!, K!, PRE!, S!)

Single-stemmed, densely leafy shrub, 0.7 m high. Stem much-branched; branches erect to spreading, silvery pubescent; fascicles sometimes present in leaf axis. Leaves alternate, spreading, 5.0–17.0 × 0.8–1.0 mm, linear, mucronate, rarely entire (entire on peduncles), trifid, narrowed into petiole-like base, without secondary basal lobes, silvery sericeous on both surfaces, fleshy; basal swelling present, continuous with stem ribs; lobes 3, 1.0–8.0 × 0.8–1.0 mm, linear, mucronate. Capitula radiate, heterogamous, terminal, solitary, pedunculate; peduncles 20.0–40.0 mm long, silvery pubescent. Involucre 5.0–6.0 × 6.0–7.0 mm, hemispherical to cyathiform, not tapering at the base; involucral bracts 3- or 4-seriate, tightly arranged, margins and apices scarious, membranous apices of all bracts 0.3–1.3 mm long, pubescent, brown margins present, median resin canals present; outer bracts lanceolate to ovate, 2.1–2.4 mm long, acute to rounded; middle bracts lanceolate to ovate, 2.2–2.6 mm long, rounded; inner bracts ovate, 3.0–4.0 mm long, rounded; innermost bracts linear to oblong, 4.5–4.8 mm long, rounded. Receptacle convex; paleae in marginal series, linear to oblong, 4.3–5.9 mm long, rounded, rigid with scarious margins and apices, scarious apices 1.0–2.0 mm long. Ray florets 12 to16; tube 1.4–1.7 mm long; limb obovate, 7.2–7.7 × 3.1–3.5 mm, apically 3-dentate, white. Disc florets 30–40, without resin canals; corolla 1.7–2.0 mm long, with only glandular trichomes, yellow; tube 1.0–1.1 mm long; limb campanulate, 0.7–1.0 mm long (excluding lobes); lobes spreading, ± 0.6 mm long, triangular. Anthers 2.0–2.7 mm long (including apical appendage); apical appendage ovate. Style 2.0–2.1 mm long (excluding branches); branches 0.4–0.6 mm long. Cypselas 1.7 × 0.7 mm, oblong to obovate, 11-ribbed, apical rim absent, glandular trichomes present, dense, scattered, mucilaginous when soaked, discontinuous resin canals in ribs absent. Figure 7.

**Diagnostic Characters**—Phymaspermum trifidum is closely related to *P. thymelaeoides* with which it shares the radiate heads, slightly fleshy, silvery sericeous leaves and hairy involucral bracts. *Phymaspermum trifidum* can however be distinguished by the consistently trifid leaves, the broad membranous appendages on the innermost involucral bracts and the glabrous disc floret tubes.

**Distribution and Ecology**—Phymaspermum trifidum appears to be highly restricted and is known from only three localities between McGregor and Bonnievale. It grows in alluvial sand at an altitude of around 150–200 m (Fig. 7G). Flowering...

Phymaspermum junceum sensu Less. (1832) non Osteospermum junceum Berg. [See Magee et al. 2013]

Single-stemmed, leafy shrub, 0.5–1.6 m high. Stem much-branched; branches erect to spreading, silvery pubescent; fascicles sometimes present in leaf axils. Leaves alternate, spreading to erect, 6.0–25.0 × 1.1–2.0 mm, linear, mucronate, revolute, entire to trifid, without petiole-like base, sometimes with secondary basal lobes, silver hairs on both surfaces, fleshy to leathery; basal swelling present, continuous with stem ribs; lobes 2–3, 2.0–7.0 × 1.0 mm, linear, mucronate. Capitula radiate, heterogamous, terminal, solitary, with 0 additional capitula from leaf axils below, pedunculate; peduncles 15–95 mm long, silvery pubescent. Involucre 5.0–6.0 × 6.0–9.0 mm, hemispherical, rarely tapering at the base; involucral bracts 4-seriate, tightly arranged, margins and apices scarious, membranous apices of all bracts 0.5–1.8 mm long, villous silvery hairs, brown margins sometimes present, median resin canals present; outer bracts triangular to lanceolate, 3.3–3.4 mm long, acute; middle bracts lanceolate to oblong, 4.3–4.5 mm long, acute; inner bracts oblong, 5.7–6.2 mm long, acute to obtuse; innermost bracts oblong, 6.5–7.0 mm long, rounded. Receptacle convex; paleae in marginal series, narrowly oblong, 5.2–6.0 mm long, rounded, scarious. Ray florets 10–22, tube 1.1–4.2 mm long; limb obovate, 10.0–12.0 × 3.0–4.3 mm, apically 3-dentate, rarely entire or 2-dentate, white to mauve. Disc florets up to 100, without resin canals; corolla 3.5–4.0 mm long, with only glandular trichomes, yellow; tube 1.6–1.7 mm long; limb campanulate, 1.7 mm long (excluding lobes); lobes spreading, 0.7–0.8 mm long, triangular. Anthers 4.3–6.5 mm long (including apical appendage); apical appendage ovate. Style 2.8–3.6 mm long (excluding branches); branches 1.0–1.3 mm long. Cypselas 2.5 × 0.8 mm, oblong to obovate, 10-ribbed, apical rim absent, inconspicuous glandular trichomes present, dense, appearing sessile on ribs, mucilaginous when soaked, discontinuous resin canals in ribs absent. Figure 8.

**Diagnostic Characters**—*Phymaspermum leptophyllum* is unique in that the epidermal cells of the cypselas are antically elongated so that they obscure the ribs and hide much of the stalk on the trichomes, making them appear sessile. It can be confused with the sympatric and closely related *P. aphyllum* both of which have linear leaves and...
lanceolate to oblong involucral bracts (outer bracts of \textit{P. leptophyllum} are sometimes triangular). However, in addition to the anticlinally elongated epidermal cells of the cypselas \textit{P. leptophyllum} differs from \textit{P. aphyllum} in that it is more densely leafy, with persistent leaves, ± 1.0–2.0 mm wide, the branches are not longitudinally white striped and the peduncles do not become spinescent (Fig. 1L).

**Distribution and Ecology**—\textit{Phymaspermum leptophyllum} is endemic to the Little Karoo where it occurs on quartz outcrops (Vlok and Schutte-Vlok 2010), at an altitude of 400–650 m, from Montagu to Oudtshoorn (Fig. 8G). Flowering is from May to November.

**Additional Specimens Examined**—\textbf{SOUTH AFRICA. Western Cape:} Montagu: Wildhebekloof Pass, 44 km E of Montagu (=AD); Nordenstam and Lindgren 1194 (PRE); Near Barrydale (=DC); Morris 168 (BOL, PRE); 12 miles SW of Barrydale (=DC); \textit{Theron} 2032 (BOL); \textit{Ladismith} 3321 (Ladismith (=AD); Bayliss 2814 (NBG); \textit{Levyns} 7487 (BOL); \textit{Levyns} 7487 a (BOL); Ladismith, koppie behind the town (=AD); \textit{Levyns} 11145 (BOL); Little Karoo, Noukloof Nature Reserve, level spur N of road, 2.8 km from north gate where road reaches its highest point (=CA); \textit{Laidler} 9371 (NBG, PRE); Little Karoo, Gouritsrivier (=DC), \textit{Ecklon} 622 (MO-image, P-image, S-image). \textit{3322 (Oudtshoorn):} lower rain slopes of Outeniqua Mountains, near Saffraanrivier Farm (=CC), \textit{Vlok} 2402 (PRE); road from Oudtshoorn to Robinson Pass (=CC); \textit{Ueckert and Oberprieler} 10274 (B-image); 23 km along R328 from Oudtshoorn to Mossel Bay (=CC), \textit{Magee} and \textit{Boehm} 372 (NBG); \textit{Perdepoort} (=CD), \textit{Tyson} 3078 (BOL, SAM); Uniondale, Laudina (=DB), \textit{Esterhuysen} 6502 (PRE, BOL; three sheets); Laudina store (=DB), \textit{Acocks} 14642 (PRE).

**Precise Locality Unknown:** Karoo, \textit{Ecklon} s.n. (G-DC-image).

### 6. \textit{Phymaspermum aphyllum} Magee and Ruiters sp. nov.—

**Type:** \textbf{SOUTH AFRICA. Western Cape, Montagu (3320):} Along road between Ladismith and Laingsburg, in road reserve (=BD), 2 June 2007, \textit{Vlok \& Schutte} 596 (holotype: NBG; isotype: K!)

Single-stemmed, very sparsely leafy shrub, 0.5–1.0 m high. Stem much-branched; branches erect to spreading, spine-tipped, densely white woolly between ribs; fascicles rarely present in leaf axils. Leaves alternate, very sparse, caducous, apressed to erect, 2.0–20.0 × 0.5 mm, linear, mucronate, revolute, entire, without petiole-like base, without secondary basal lobes, glabrous on both surfaces, fleshy to leathery; basal swelling present, continuous with stem ribs. Capitula radially heterogamous, terminal, solitary, with 0–1 additional capitula from leaf axils below, pedunculate; peduncules 25.0–38.0 mm long, silvery pubescent. Involucre 5.0–6.0 × 6.0–9.0 mm, hemispherical, rarely tapering at the base; involucral bracts 4-seriate, tightly arranged, margins and apices scarious, membranous apices of all bracts 0.3–0.5 mm long, silvery villous, brown margins absent, median resin canals present; outer bracts lanceolate, 1.5–1.6 mm long, acute; middle bracts lanceolate, 2.0–2.2 mm long, acute; inner bracts lanceolate to oblong, 2.5–3.5 mm long, acute to obtuse; innermost bracts oblong, 3.5 mm long, rounded. Receptacle convex; paleae in marginal series, narrowly oblong, 3.0–4.5 mm long, rounded, scarious. Ray florets 9–10; tube 2.0–2.8 mm long; limb obovate, 5.7–11.4 × 3.2–4.0 mm, apically 3-dentate, white. Disc florets ± 50, without resin canals; corolla 1.6–2.0 mm long, with only glandular trichomes, yellow; tube 0.7–1.0 mm long; limb campanulate, 0.7–1.8 mm long (excluding lobes); lobes spreading, 0.5–0.7 mm long, triangular. Anthers 2.0–2.4 mm long (including apical appendage); apical appendage oblong. Style 2.0–2.2 mm long (excluding branches); branches 0.4 mm long. Cypselas 2.0–2.5 × 0.5–0.8 mm, obovate, 10- to 11-ribbed, apical rim absent, glandular trichomes present, dense, scattered, mucilaginous when soaked, discontinuous resin canals in ribs absent. Figure 9.

**Diagnostic Characters**—\textit{Phymaspermum aphyllum} has in the past been incorrectly identified as \textit{P. junceum} (Berg.) Less. (the latter now a synonym of \textit{Osteospermum junceum}, Magee et al. 2013). It is a sparsely leafy shrub with caducous leaves, ± 0.5 mm wide, longitudinally white striped stems which are densely white wooly between the ribs and persistent peduncles which often become spinescent. It differs further from the closely related \textit{P. leptophyllum} by the obviously ribbed cypselas with prominently stalked myxogenic trichomes. In \textit{P. leptophyllum} the cypselas appear unribbed and the myxogenic trichomes appear sessile due to the prominently elongated epidermal cells.

**Distribution and Ecology**—\textit{Phymaspermum aphyllum} is known from only a handful of localities between Barrydale and the Witteberg in the Little Karoo at an altitude of around 700 m (Fig. 9G). The leaves of this species are apparently highly palatable for livestock (Vlok and Schutte-Vlok pers. comm.). Flowering is from June to December.

**Additional Specimens Examined**—\textbf{SOUTH AFRICA. Western Cape:} \textit{3320 (Montagu):} 14 miles SSE of Laingsburg (=BB); \textit{Acocks} 20509 (PRE); Ladismith, Farm Comae, near Plathuis Station (=DB), \textit{Van Breda} 4407 (PRE), Swellendam, “Poortfontein”, along Barrydale/Ladismith road (=DD), \textit{Van Breda} 4545 (PRE).

Single-stemmed, densely leafy shrublet, 0.3–1.2 m high. Stem much-branched; branches erect to spreading, glabrous to silvery tomentose; fascicles present in leaf axes. Leaves alternate, closely imbricate, appressed, 1.0–5.0 × 0.5–2.0 mm, ovate to lanceolate, acute to mucronate, entire, without petiole-like base, without secondary basal lobes, glabrous on both surfaces, bony; basal swelling present, continuous with stem ribs. Capitula radiant, heterogamous, terminal on short axillary shoots, solitary, with 0–3 additional capitula from leaf axes below, prominent peduncles absent. Involucre 4.0–7.0 × 4.0–8.0 mm, hemispherical to cyathiform, tapering at the base; involucral bracts 3-seriate, tightly arranged, margins and apices scarious, membranous apices of all bracts 0.7–1.0 mm long, scarious texture, brown margins absent, median resin canals present; outer bracts broadly obovate, 7.0–8.0 mm long, rounded; middle bracts broadly obovate sometimes oblong, 3.0–3.5 mm long, rounded; inner bracts narrowly obovate sometimes oblong, 4.3–4.5 mm long, rounded. Receptacle convex to flat; palea in marginal series, 3.8–4.0 mm long, rounded, scarious. Ray florets 11–14; tube 1.7–2.0 mm long; limb ovate to obovate, 7.0–8.5 × 2.7–3.0 mm, apically 3-dentate, rarely entire sometimes with longer middle tooth, white to purplish. Disc florets 22–47, without resin canals; corolla 2.0–2.3 mm long, with only glandular trichomes, yellow to purple; tube 0.9–1.0 mm long; limb very narrowly campanulate, 1.0–1.2 mm long (excluding lobes); lobes erect, 0.3–0.5 mm long, triangular. Ancers 2.4–4.3 mm long (including apical appendage); apical appendage ovate. Style 2.2–3.8 mm long (excluding branches); branches 0.4–1.9 mm long. Cypselas 2.0 × 0.5 mm, narrowly obovate, 12-ribbed, apical rim thickened, slightly dentate, brown, glandular trichomes present, dense, mostly between ribs, mucilaginous when soaked, discontinuous resin canals in ribs absent. Figure 10.

**Diagnostic Characters—**Phymaspermum appressum is easily recognised by the prominently appressed leaves, entirely scarious involucral bracts and purplish ray florets. It can only be confused with the closely related *P. oppositifolium*, from which it differs in the alternate leaves, the hemispherical to cyathiform involucres, and the ovate to obovate involucral bracts.

**Distribution and Ecology—**Phymaspermum appressum is endemic to sandstone slopes and ridges above 940 m within the Little Karoo, from Anysberg to the Witteberg (Fig. 10G). Flowering is from April to December.

8. Phymaspermum oppositifolium Magee and Ruiters sp. nov. —**TYPE: SOUTH AFRICA.** Eastern Cape, Steytlerville (3324): Kouga Mountain, Riverside (–CD), 20 January 2000, Easten-Brown 02 (holotype: NBG!)

Single-stemmed, densely leafy shrub, 1.5 m high. Stem much-branched; branches erect to spreading, glabrous; fascicles present in leaf axes. Leaves opposite, closely imbricate, appressed to sometimes erect, 2.0–5.0 × 1.0–2.0 mm, lanceolate, acute to acuminate, sometimes mucronate, entire, without petiole-like base, without secondary basal lobes, glabrous on both surfaces, bony; basal swelling present,
continuous with stem ribs. Capitula radiate, heterogamous, terminal on short axillary shoots, solitary, with 0–3 additional capitula from leaf axils below, prominent peduncles absent. Involucre 5.0–6.0 × 4.0–5.0 mm, funnel-shaped, tapering at the base; involucral bracts 4-seriate, tightly arranged, margins and apices scarious, membranous apices of all bracts 2.4–2.5 mm long, scarious texture, brown margins absent, median resin canals present; outer bracts lanceolate, 3.4 mm long, acute; middle bracts lanceolate, 4.0–4.5 mm long, acute; inner bracts lanceolate, 5.5 mm long, rounded. Receptacle convex; paleae in marginal series, linear, ± 4.0 mm long, rounded, scarious. Ray florets ± 20, without resin canals; corolla 2.0–2.5 mm long, funnelform, yellow to purplish, limb 4.8–2.3 mm, apically 3-dentate, white to purple. Disc florets ± 20, without resin canals; corolla 1.0–2.0 mm long, rounded, scarious. Anthers 2.4 mm long (including apical appendage); apical appendage elliptic to lanceolate, 1.2 mm long (excluding branches); branches ± 0.3 mm long. Cypselas 1.9 × 0.6 mm, narrowly obovate, ribbed, apical rim thickened, entire, brown, glandular trichomes present, distribution unknown, discontinuous resin canals in ribs absent. Figure 11.

**Diagnostic Characters**—*Phymaspermum oppositifolium* is the only opposite leafed species within the genus. It shares the appressed leaves, entirely scarious involucral bracts and purplish ray florets with the closely related *P. appressum* from which it can be distinguished further by the funnel-shaped involucres and lanceolate involucral bracts.

**Distribution and Ecology**—This species is known only from the type collection in the Kouga mountains of the Eastern Cape (Fig. 11G), where it was collected at an altitude of 250 m. It was found flowering in January and the collector noticed seeing very few plants (Eusten-Brown pers. comm.).

Single-stemmed, leafy shrub, 0.45–1.5 m high. Stem few-branched; branches erect, glabrous with few glands; fascicles rarely present in leaf axils. Leaves alternate, erect to spreading, 3.0–20.0 × 0.8–1.5 mm, linear, mucronate, entire, without petiole-like base, without secondary basal lobes, glabrous on both surfaces, leathery; basal swelling present, continuous with stem ribs. Capitula discoid or radiate, homogamous or heterogamous, terminal, solitary, with 3–5 additional capitula from leaf axils below, pedunculate; peduncles 7.0–48.0 mm long, glabrous. Involucre 4.0–6.0 × 3.0–6.0 mm, broadly to narrowly campanulate or funnel-shaped, usually tapering at the base; involucral bracts 3- or 4-seriate, tightly arranged, margins and apices scarious, sometimes completely scarious especially third and fourth bracts, membranous apices of inner bracts 0.5–1.0 mm long, glabrous, brown margins absent, median resin canals present; outer bracts deltoid to lanceolate, 1.2–1.8 mm long, acute, sometimes mucronate; middle bracts deltoid to lanceolate or elliptic, 1.8–2.8 mm long, rounded to acute or sometimes mucronate; inner bracts narrowly obelliptic to lanceolate or linear, 2.2–3.2 mm long, rounded; innermost bracts narrowly obelliptic to linear, 2.4–4.0 mm long, rounded. Receptacle flat to convex; paleae in marginal series, narrowly obelliptic to linear, 2.7–4.0 mm long, rounded, scarious. Ray florets (when present) 3–4; tube 1.0–1.7 mm long; limb obelliptic, 3.0–5.0 × 1.8–2.8 mm, apically 3-dentate, white. Disc florets 13–32, without resin canals; corolla 2.0–3.5 mm long, with only glandular trichomes, yellow; tube 1.0–2.6 mm long; limb campanulate, 1.0–1.7 mm long (excluding lobes); lobes spreading, ± 0.7 mm long, triangular. Anthers ±2.8 mm long (including apical appendage); apical appendage elliptic to lanceolate. Style 1.8–2.6 mm long (excluding branches); branches 0.1–0.4 mm long. Cypselas 2.5 × 1.0 mm, obovate, 10-ribbed, apical rim thickened, entire to slightly dentate, glandular...
trichomes present, sparse, scattered, not mucilaginous when soaked, discontinuous resin canals in ribs absent. Figure 12.

**Diagnostic Characters**—*Phymaspermum aciculare* is the only species in the genus which can have either discoid or radiate heads. It can be distinguished from the other radiate species by the sparsely radiate heads with no more than four rays, with limbs less than 5 mm long. Amongst the discoid species it shares the non-corymbose capitula and large cypselas (>0.8 mm wide) with *P. erubescens* and *P. plegarea*. It can however be readily distinguished by the glabrous stem and leaves and the smaller (3.0-6.0 mm wide), obconical, sometimes few radiate capitula with 3-5 additional capitula from leaf axils below.

**Distribution and Ecology**—*Phymaspermum aciculare* is widely distributed from McGregor in the Western Cape to Bloemhof in the North West Province with a disjunction in Namibia (Fig. 12G). A similar Namibian disjunction has also been documented in *Melolobium* (Moteete and Van Wyk 2006) as well as *Dictulis* (Schutte and Van Wyk 1988). This species prefers hard, dry soil and sometimes occurs on dolerite, at altitudes of 40 m to 1,700 m. It is reportedly grazed by livestock (*Henrici* 2844, BOL; *Roux* 36, PRE; *Liebenberg* 7673, B-image, PRE). Flowering is from September to May.

**Additional Specimens Examined**—NAMIBIA. 2217 (Windhoek): Dobra river bank (–AC), Koenen 580 (WIND); Farm Hoeheno (–CB), Walter and Walter 1177 (B-image, PRE); Lichtenstein (–CC), Dinter 3527 (B–two images, PRE, SAM).

**Precise Locality Unknown**: Luagawavlakte, MacOwan 1087 (PRE); MacOwan 38749 (SAM).

Multistemmed, leafy shrublet, up to 0.3 m high. Stems few-branched; branches erect, sparsely hairy to silver villous or

---

**Fig. 12.** *Phymaspermum aciculare*. A. Leaves. B. Capitula. C. Involucral bracts (outmost to innermost series, from left) and single pales (far right). 
Stems few-branched; branches erect, silvery villous; fascicles favours sandstone in grasslands at altitudes of 600–1,700 m, high. Flowering is from October to March.

**Phymaspermum peglerae**

—a presset to erect, 2.0–10.0 × 1.0 mm, linear to lanceolate, acute to acuminate, revolute, entire, without petiole-like base, without secondary basal lobes, glabrous to silver-villous adaxially, glabrous abaxially, fleshy to leathery; basal swelling present, continuous with stem ribs. Capitula discoid, homogamous, terminal, solitary, with 0–3 additional capitula from leaf axils below, pedunculate; peduncles 15.0–60.0 mm long, glabrous. Involucrare 5.0–7.0 × 5.0–7.0 mm, hemispherical to cyathiform, rarely tapering at the base; involucral bracts 4-seriate, tightly arranged, margins and apices scarious, membranous apices of all bracts 0.8–1.3 mm long, glabrous, brown margins absent, median resin canals present; outer bracts deltoid to lanceolate, 2.7–3.5 mm long, acute to attenuating; middle bracts triangular ovate, 4.0–4.3 mm long, acuminate; inner bracts lanceolate, 4.6–5.2 mm long, rounded. Receptacle convex; paleae in marginal series, ob lanceolate to oblong, 4.6–5.2 mm long, rounded, membranous with scarious margins and apices, scarious apices 0.6–1.2 mm long. Disc florets ± 20, without resin canals; corolla 2.0–3.0 mm long, with only glabrous trichomes, yellow; tube 1.0–1.2 mm long; limb narrowly campanulate, 1.0–1.2 mm long (excluding lobes); lobes spreading, 0.6–1.0 mm long, triangular ovate. Anthers 2.8–3.6 mm long (including apical appendage); apical appendage obovate. Style 2.4–2.8 mm long (excluding branches); branches 0.4–1.0 mm long. Cypselas 3.6 × 1.0 mm, obovate, 11-ribbed, apical rim thickened, denticate, glandular trichomes present, sparse, scattered, not mucilaginous when soaked, discontinuous resin canals in ribs absent. Figure 13.

**Diagnostic Characters**—Phymaspermum erubescens could be confused with *P. peglerae* or discoid specimens of *P. aciculare* but can be readily distinguished by the sparse to dense silvery villous or hispid indumentum on the stems and leaves (densely bronze villous in *P. peglerae* and glabrous in *P. aciculare*), the shorter leaves, 2.0–10.0 mm long and smaller cypselas (when compared to *P. peglerae*) ≤ 4 mm long.

**Distribution and Ecology**—Phymaspermum erubescens is a relatively poorly collected species which occurs from Lady Frere to King Williams Town in the Eastern Cape (Fig. 13). It favours sandstone in grasslands at altitudes of 600–1,700 m. Flowering is from October to March.

**Additional Specimens Examined**—SOUTH AFRICA. Eastern Cape: 3127 (Lady Frere: Farm Ebuhleni ca. 27 km N of Indwe along R 396, track up to Vodacom tower (–AD), Magee et al. 436 (NBG); Farm Ebuhleni, SW mountain slopes, N of homestead (–AD), Bester 7396 (PRE); hills near Cala (–DA), Esterhuysen 29184 (BOL); Ngeboco (–DB), Acoks 12161 (PRE). 3227 (Stutterheim: King Williams Town (–CD), Flamagan 23164 (NBG).

**Type Locality Unknown:** Kaftraria, Sim 19851 (PRE).

Multistemmed, densely leafy shrublet, 0.6–0.7 m high. Stems few-branched; branches erect, silvery villous; fascicles sometimes present in leaf axils. Leaves alternate, erect, 9.0–18.0 × 1.0 mm, linear, acuminate to mucronate, entire, without petiole-like base, without secondary basal lobes, silvery-villous on both surfaces, fleshy; basal swelling present, continuous with stem ribs. Capitula discoid, homogamous, terminal, solitary, pedunculate; peduncles 25.0–80.0 mm long, densely silvery-tomentose. Involucrare 8.0–12.0 × 7.0–10.0 mm, hemispherical to cyathiform, not tapering at the base; involucral bracts 3-seriate, tightly arranged, margins and apices scarious, membranous apices of all bracts 0.5–1.0 mm long, densely villous, brown margins absent, median resin canals present; outer bracts lanceolate, 2.7 mm long, attenuating; middle bracts lanceolate, 3.9 mm long, acute to rounded; inner bracts oblong linear, 5.5 mm long, rounded. Receptacle convex; paleae in marginal series, oblong, ± 6.3 mm long, rounded, membranous with scarious margins and apices, scarious apices ±1.3 mm long. Disc florets ± 20, without resin canals; corolla 2.3 mm long, with only glandular trichomes, yellow; tube 1.0 mm long; limb campanulate, 1.0 mm long (excluding lobes); lobes spreading, ± 0.5 mm long, triangular-ovate. Anthers ± 3.0 mm long (including apical appendage); apical appendage obovate, obtuse. Style 4.0 mm long (excluding branches); branches 0.5 mm long. Cypselas 4.6 × 1.0 mm, obovate, 12-ribbed, apical rim thickened, denticate, glandular trichomes present, sparse, scattered,
not mucilaginous when soaked, discontinuous resin canals in ribs absent. Figure 14.

**Diagnostic Characters**—*Phymaspermum peglerae* shares the discoid non-corymbose heads and large fruit with *P. erubescens* and *P. aciculare* but can be distinguished by the densely bronze villous indumentum (sparse to dense silvery villous or hispid indumentum in *P. erubescens* and glabrous in *P. aciculare*), the usually larger leaves 9.0–18.0 mm long and the largest fruit in the genus >4 mm.

**Distribution and Ecology**—*Phymaspermum peglerae* is known from only two very old collections along the banks of the Mhatha River in the Eastern Cape (Fig. 14F). This species flowers in midsummer, around January.

Additional Specimens Examined—SOUTH AFRICA. Eastern Cape: 3128 (Mthatha): Mhatha River bank (–BC), Bolus 10133 (BOL).

Multistemmed, densely leafy shrub, 0.2–2.0 m high. Stems much-branched; branches erect, grey-pubescent; fascicles never present in leaf axils. Leaves alternate, spreading, 6.0–40.0 × 0.8–8.0 mm, linear to oblong, acute to mucronate, entire to trifid, involute, narrowed into petiole-like base, without secondary basal lobes, glabrous on both surfaces, leathery; basal swelling present, continuous with stem ribs; lobes 2–3, 0.5–10.0 × 0.5–1.0 mm, linear to oblong, acute to mucronate. Capitula disciform, heterogamous, terminal, many-headed ± 30, simple to compound corymb, pedunculate; peduncles 4.0–35.0 mm long, glabrous to white tomentose. Involucres 4.0–8.0 × 3.5–8.0 mm, hemispherical, cyathiform to urceolate, sometimes tapering at the base; involucral bracts 4- or 6-seriate, with the peduncular bracts usually being the first two series, tightly arranged, margins and apices scarious, membranous apices of all bracts 0.3–1.2 mm long, glabrous to tomentose especially along the edges, brown margins absent, median resin canals present; outer bracts lanceolate, 2.0–3.0 mm long, acute; middle bracts deltoid to lanceolate, 2.2–4.2 mm long, acute; inner bracts deltoid to lanceolate, 2.2–4.3 mm long, acute to rounded; second inner bracts deltoid to lanceolate, 3.8–4.6 mm long, acuminate to rounded. Receptacle convex; pales in marginal series, oblong to linear, 3.2–3.7 mm long, acute to attenuating, scarious. Filiform florets ± 20; corolla 2.3–3.0 mm long, with glandular trichomes, zygomorphic; adaxial lobes 2, 0.7–1.0 mm long, triangular, spreading, abaxial lamina 0.3–0.6 mm long, linear, 3-dentate. Disc florets ±100, without resin canals; corolla 2.2–3.0 mm long, with only glandular trichomes, yellow; tube 1.0–2.0 mm long; limb narrowly campanulate, 0.8–1.3 mm long (excluding lobes); lobes erect to spreading,
0.4–0.6 mm long, triangular. Anthers ± 3.0 mm long (including apical appendage); apical appendage rounded to oblong. Style 2.5–3.1 mm long (excluding branches); branches 0.4–0.7 mm long. Cypselas 2.1–2.2 × 0.5 mm, obovate, 10- to 12-ribbed, apical rim thickened to membranous, entire to dentate, glanular trichomes present, sparse, scattered, not mucilaginous when soaked, discontinuous resin canals in ribs absent. Figure 15.

**Diagnostic Characters**—*Phymaspernum athanasioides* was previously considered to be a part of a complex with *P. bolusii* and *P. montanum*, distinguished by apparent differences in their involucral bracts. However, upon further study, these characters were found to be highly variable and no clearly recognisable characters could be found to distinguish between them. As a result only a single variable species, *P. athanasioides*, is recognised here. It is readily distinguished from all other species in the genus by the marginal filiform florets and from the other species with corymbose arranged capitula by the absence of fascicles in the leaf axils and by the mostly entire leaves, which rarely become 2- or 3-fid.

**Distribution and Ecology**—*Phymaspernum athanasioides* is widely distributed from around Harrismith in KwaZulu Natal to Musina in Limpopo and extending into Swaziland and further north into Zimbabwe (Fig. 15G). It grows in mixed bushveld and grassland, especially on quartzite or sandstone, at an altitude of 1,000 m to 1,750 m. Flowering time is throughout the year but especially in August, hence its vernacular name August Gold.

**Additional Specimens Examined**—SOUTH AFRICA. Limpopo: 2230 (Musina): Southpansberg, Entabeni Forest Reserve (–CC), Codd 3038 (PRE); Venda, Musekwa location (–CC), Du Toit 298 (PRE), Hangklip, Louis Kral, Waterberg Transvaal (–CC), Maguire 1426 (NBG), 2329 (Polokwane): Southpansberg Mountain, Letsume at foot of cliffs (–AB), Venter 6233 (PRE), Rogers 19904 (PRE), Vigo, Farm Llewellyn 35 on Southpansberg (–AB), Venter 10,755 (PRE), Makhado (–BB), Breger 24364 (PRE); Blauwberg, south slopes at plateau (–CD), Esterhuyzen 21,435 (BOL), Tomazon farm (–DD), Nienaber 26 (PRE), Haenertsburg, Iron Crown Mountain (–DD), Venter 10.855 (PRE), 2330 (Tzaneen): Polokwane, Wolkw (–CC), Van der Merwe 33 (PRE), 2329 (Zebediela): Mokopanet district, summit of highest peak, Zebedia mountains (–AA), Galpin s.n. Pentzia tysonii Thell. in Vierteljahrsschr. naturf. Ges. Zürich. 61: 454 (1916).—TYPE: SOUTH AFRICA. KwaZulu Natal, Pietermaritzburg (2930): Curries Post (PRE), 24 Apr. 1891, Wood 4457 (lectotype: Z–image!, designated here; isolectotype: BOL!, NH–image!) [Note: The specimen in Z, where Thellung was selected as it forms part of the collection which Thellung would have studied.]

Multistemmed, densely leafy shrublet, 0.4–0.6 m high. Stems few-branched; branches erect, white to silvery tomentose; fascicles present in leaf axils. Leaves alternate, spreading, 4.0–35.0 × 0.5–0.8 mm, linear, sometimes involute, deeply pinnatifid, narrowly triangular. Anthers 2.7–3.2 mm long, white to silvery tomentose. Involucral bracts 4- or 5-seriate, tightly arranged, margins and apices scarious, membranous apices of all bracts 0.3–0.8 mm long, glabrous to slightly or densely pubescent or villous, especially edges, very rigid, brown margins light and inconspicuous, median resin canals present; outer bracts deltoid to lanceolate, 2.2–3.3 mm long, acute to acuminate; middle bracts deltoid to ovate, 2.7–3.4 mm long, acuminate; inner bracts deltoid to lanceolate, 2.7–4.0 mm long, acuminate to rounded; second inner bracts ovate, 3.0–5.0 mm long, rounded; innermost bracts ovate, 4.3–5.8 mm long, rounded. Receptacle convex to flat; paleae in two marginal series, linear to oblone, 4.3–6.0 mm long, rounded, rigid with scarios margins and apices, scarious apices 0.8–1.1 mm long. Disc florets 37–55, without resin canals; corolla 2.3–3.2 mm long, with only glandular trichomes, yellow; tube 1.4–1.8 mm long; limb narrowly campanulate, 1.0–1.4 mm long (excluding lobes); lobes spreading, 0.6–1.0 mm long, narrowly triangular. Anthers 2.7–3.8 mm long (including apical appendage); apical appendage oblone. Style 2.0–3.3 mm long (excluding branches); branches 0.5 mm long. Caryopses 1.8–2.0 × 0.5 mm, oblone to obovate, 11-ribbed, apical rim thickened, entire to slightly dentate, glandular trichomes present, sparse, scattered, not mucilaginous when soaked, discontinuous resin canals in ribs absent. Figure 16.

**Diagnostic Characters**—**Phymaspermum woodii** shares the narrowly campanulate to urceolate involucres and flat, deltoid to ovate, closely appressed involucral bracts with *P. argenteum*.
but can be distinguished by the sparsely villous leaves with narrower lobes (≤0.5 mm wide) and the 5-seriate, apically constricted involucres with at most indistinct brown margins. This species could also be confused with the spring flowering *P. pinnatifidum* with which it shares the smaller habit and narrowly lobed leaves but can be readily distinguished by the much narrower campanulate to urceolate, apically constricted involucres with closely appressed involucral bracts, the absence of a prominent membranous crown on the fruit and the later flowering time (late summer into autumn).

**Distribution and Ecology**—*Phymaspermum woodii* is distributed on rocky hillsides in moist grasslands along the southern and eastern Drakensberg in KwaZulu Natal and Free State (Fig. 16F), at altitudes of 1,700–2,750 m. Flowering is in late summer to autumn from February to May.

**Additional Specimens Examined**—SOUTH AFRICA. Free State: 2828 (Bethlehem): Royal Natal National Park, Tugela gorge (–DB), Hilliard 2851 (NU), KwaZulu Natal: 2829 (Harrissmith): Cathedral Peak (–CC), Unknown s.s. (NU); Cathedral Peak Reserve, Mikos Pass (–CC), Magee et al. 460 (NBG); Cathedral Peak Forest Reserve station, on spur leading to Organ Pipes Pass (–CC), Killick 1705 (BOL, PRE). 2929 (Underburg): Giants Castle, contour walk (–AD), Retief 1667 (PRE); Giants Castle Game Reserve, Bamman se area (–AD), Trauseld 758 (PRE); Highmoor Forest Reserve (–BC), Hilliard 4814 (NU); Merinodale (–BC), Wright 483 (NU); Garden Castle Forest Reserve, Mlanzaba Valley (–CA), Hilliard and Buttt 15061 (NU); 5–7 miles NNW of Castle View farm, headwaters of Mahlangubu River (–CB), Hilliard and Buttt 15271 (NU–image).

2930 (Pietermaritzburg): Near Currys Post (–AC), Wood 4457 (BOL), Wood 1007 (GRA–image, SAM); Table Mountain (–DA), Acocks 21505 (PRE); 3029 (Kokstad): Summit of Ntsikeni Mountain in Ntsikeni Nature Reserve (–AB), Magee et al. 547 (NBG); Summit of Mount Currie (–AD), Magee et al. 447 (NBG).

Multistemmed, densely leafy shrub, 0.3–1.5 m high. Stems few-branched; branches erect, sparsely to densely silvery tomentose; fascicles present in leaf axils. Leaves alternate, spreading, 8.0 × 0.8, tomentose; fascicles present in leaf axils. Leaves alternate, few-branched; branches erect, sparsely to densely silvery-tomentose. Involucre 5.0–15.0 mm long, narrowly to broadly campanulate to urceolate, tapering at the base; involucral bracts 3–4-seriate, tightly arranged, margins and apices scarious, membranous apices of all bracts 0.5–1.0 mm long, glabrous to villous (rarely beyond margins), brown margins dark and distinct, median resin canals present; outer bracts deltoid to lanceolate, 1.7–1.9 mm long, acuminate; middle bracts deltoid to ovate, 2.4–3.1 mm long, acuminate; inner bracts broadly oblong to lanceolate, 2.8–3.8 mm long, acuminate to rounded. Receptacle convex; paleae in marginal series, oblong, linear, 3.8–4.5 mm long, rounded, rigid with scarious apices, scarious apices ± 0.5 mm long. Disc florets 6–23, without resin canals; corolla 2.3–3.1 mm long, with only glandular trichomes, yellow; tube 1.2–1.7 mm long; limb narrowly to broadly campanulate, 1.0–1.4 mm long (excluding lobes); lobes spreading, 0.7–1.0 mm long, narrowly to broadly triangular. Anthers 2.8–3.4 mm long (including apical appendage); apical appendage oblong to lanceolate. Style 2.0–3.0 mm long (excluding branches); branches 0.2–0.3 mm long. Cypselas 2.0–2.8 × 0.7 mm, oblong, 10-ribbed, apical rim thickened, entire, brown, glandular trichomes present, sparse, scattered, not mucilaginous when soaked, discontinuous resin canals in ribs absent. Figure 17.

**Diagnostic Characters**—*Phymaspermum argenteum* shares the fleshy, usually silvery sericeous leaves with the closely related *P. comptonii*, but can be readily distinguished by the narrowly campanulate involucres with closely appressed, deltoid to ovate involucral bracts with prominent dark margins.

**Distribution and Ecology**—*Phymaspermum argenteum* occurs from around Polokwane and Zebediela in Limpopo to near Pilgrims Rest in Mpmulanga (Fig. 17F). It is found in grassland vegetation in dolomite soils at an altitude of 1,450–2,080 m. It flowers from May to September.
15. Phymaspermum comptonii Magee and Ruiters sp. nov. —

**TYPE:** SWAZILAND. Mbabane (2631): Bomvu ridge (AA), 25 Mar. 1964, Compton 32016 (holotype: NBG; isotype: PRE-2 sheets!)

Multistemmed, densely leafy shrublet, 0.75–1.0 m high. Stems few-branched; branches erect to spreading, sparsely to densely silvery tomentose to villous, with purplish tinge; fascicles present in leaf axils. Leaves alternate, spreading to erect, 7.0–15.0 × 0.5–1.0 mm, linear when undissected, mucronate, involute, entire to pinnatifid, narrowed into petiole-tinge; fascicles present in leaf axils. Leaves alternate, spreading to spreading to recurved, 3.0–15.0 × 0.5–1.5 mm, linear, mucronate. Capitula discoid, homogamous, terminal, involucral bracts 3-seriate, linear, loosely appressed, margins and apices scarious, membranous or with prominent brown margins.

**Distribution and Ecology**—Phymaspermum comptonii is a near endemic of Swaziland, extending slightly over the South African border around Barberton (Fig. 18F). It grows in grassland at an altitude of 1,100–1,700 m. Flowering is from December to May.

**Additional Specimens Examined**—SOUTH AFRICA. Mpumalanga: 2531 (Komatiport): Barberton Mountainlands Nature Reserve (CC), Burrows 8119 (PRE); Ida Dayer Nature Reserve 38 km SE of Barberton (CC), Muller 2057 (PRE). SWAZILAND. 2631 (Mbabane): Mbabane Forbes Reef, Ngwenya mountains near Oshoek border with South Africa, Bomvu Ridge (AA), Brusse 6335 (PRE); Bomvu Ridge (AA); Compton 31199 (PRE), Compton 28823 (PRE-two sheets).

Multistemmed, densely leafy shrub, 0.25–0.5 m high. Stems unbranched; branches erect, glabrous or with few silvery-villosus hairs, sometimes woolly or matted; fascicles present in leaf axils. Leaves alternate, erect to spreading, 5.0–32.0 × 0.2–1.0 mm, linear, deeply pinnatifid, narrowed into petiole-like base, sometimes with secondary basal lobes, silky-pubescent silvery hairs on both surface, leathery; basal swelling present, continuous with stem ribs; lobes 7–9, 4.0–25.0 mm, filiform to linear, attenuating. Capitula discoid, homogamous, terminal, few- to many-headed (5–30), simple to compound corymbs, pedunculate; peduncles 4.0–35.0 mm long, glabrous to matted. Involucres 6–7 × 4–5 mm, funnel-shaped to cyathiform, rarely tapering at the base; involucral bracts 3- or 4-seriate, loosely arranged, margins and apices scarious (curved shape due to thin rigid centres with resin canals), membranous apices of all bracts 0.2–3.3 mm long, rounded, rigid with scarious margins and apices, sometimes wooly or matted, discontinuous resin canals in ribs present. Receptacle convex; paleae in marginal series, linear to oblong, 3.3–5.1 mm long, rounded, rigid with scarious margins and apices, scarious apices 0.7–1.0 mm long. Disc florets 38–44, without resin canals; corolla 2.3–2.5 mm long, with only glandular trichomes, yellow; tube 1.2–1.5 mm long; limb campanulate, 1.0 mm long (excluding lobes); lobes spreading, 0.6–1.0 mm long, triangular to triangular-ovate. Anthers 2.8–3.2 mm long (including apical appendage); apical appendage lancelate. Style 2.1–2.8 mm long, glabrous to matted. Involucre 6 mm long, 2.5 mm wide, with only myxogenic trichomes.

Diagnostic Characters—Phymaspermum pinnatifidum is a small, spring flowering multistemmed shrublet with discoid corymbose arranged capitula and cypsela with a prominent membranous apical crown. Together with *P. acerosum* it does not have myxogenic trichomes on the cypsela (the generic synapomorphy) but rather prominent resin canals in the cypsela ribs. It can be readily distinguished from *P. acerosum* by its earlier flowering time, smaller stature (less than 0.5 m tall) with thin herbaceous stems, the broader funnel or cup-shaped involucres and the prominent membranous apical crown on the cypsela. Its small size means that it could also be confused with *P. woodii* but can be readily distinguished by the broader, not apically constricted involucres with loosely appressed involucral bracts, the prominent membranous apical crown on the cypsela and the absence of myxogenic trichomes.

Distribution and Ecology—Phymaspermum pinnatifidum is restricted to the Pietermaritzburg district of the KwaZulu Natal Province (Fig. 19F) on the Natal group sandstone and is mostly found in grasslands between 450–920 m. The species is early flowering, usually in spring, between August and October, but early fires can result in even earlier flowering (Hilliard 1977).

Additional Specimens Examined—SOUTH AFRICA. KwaZulu Natal: 2930 (PFM, PRE); Mapumulo, Great Noodsberg (BD); Strey 6948 (PRE); Ndwedwe, Oswatini (BD); Strey 7745 (NU); Noodsberg, Oswatini plateau (BD), Williams 572 (PRE); Camperdown, Drummond (DA), Rump s.n. (NU), Galpin 10297 (PRE); New Hanover, Botha’s Hill (DA), Young 2235 (PRE), Wood 1480 (SAM); Table Mountain (DA), Hilliard 3986 (NU), Killick 188 (NU), Killick 673 (NU, PRE); Cato Ridge, Mkabela near Ekuthuleni (DA), Williams 393 (PRE); 8 km S of Wartburg, near Ekuthuleni, on farm Windy Hill (DA), Balkwill and Balkwill 4655 (B-image); Inanda (DA), Wood 168 (SAM, BOL), Wood 606 (BM-image); Inanda, Elephant’s Trunk (DB), Strey 6966 (NU); Ndwedwe, Inanda mountain (DB), Hilliard 2047 (NU); Richmond, Mid-Illovo centre, Farm...

**TYPE:** SOUTH AFRICA. KwaZulu Natal, Natal Shepstone (3030): ‘Omcomas et Omsanculo’ [Umkoomaas and Umzimkulw river] (–BC), 1852, Drège 5037 (lectotype: G–DC sheet G00455519–image!, designated here; islectotype: BM–image!, HAL–image!, HBG–image! two sheets, K–image!, S–image! two sheets, SAM!). [Note: There are five Drège collections of this species in G–DC, but this is the only specimen that bears both the collection number and locality.]

**PENTZIA PINNATIFIDA** var. chenoeloides Hutch. in Kew Bull. 10: 241 (1916). —**TYPE:** SOUTH AFRICA. Limpopo, Tzaneen Natal (2330): Near Murchison (–DC), 1884/5, Wood 3110 (lectotype: Z sheet 00000376–image!, designated here; islectotype: Z sheet 00000376–image!, Z sheet 00000376–image!). [Note: Thellung cited five collections; this collection of three specimens was chosen because the selected specimen has abundant flowering materials.]

Multistemmed, densely leafy shrub, 0.3–1.8 m high. Stems unbranched to few-branched; branches erect, glabrous or scabrous to silvery villous; fascicles present in leaf axes. Leaves alternate, spreading, 6.0–40.0 × 0.5–1.0 mm, linear when undissected, mucronate, sometimes involute, entire (usually on upper branches) to deeply pinnatifid, narrowed into petiole-like base when dissected, sometimes with secondary basal lobes, glabrous to silvery villous on both surfaces, leathery; basal swelling present, continuous with stem ribs; lobes 3–9, 2.0–24.0 × 0.5–1.0 mm, linear, mucronate. Capitula discoid, homogamous, terminal, few–to many-headed (5 to +100), simple or compound corymbs, pedunculate; peduncles 8.0–42.0 mm long, tomentose. involucre 3.0–6.0 × 1.5–3.0 mm, narrowly campanulate to cylindrical, tapering at the base; involucral bracts 3–4-seriate, loosely to tightly arranged, margins and apices scarious, membranous apices of inner bracts ± 0.5 mm long, glabrous to villous, brown margins absent, median resin canals present; outer bracts lanceolate, 1.4–2.5 mm long, acute to acuminate; middle bracts lanceolate, 2.4–3.5 mm long, acute to acuminate; inner bracts lanceolate to oblanceolate, 3.3–4.2 mm long, rounded. Receptacle convex; paleae in marginal series (rarely rudimentary inner paleae present), oblong to linear, 4.0–4.8 mm long, acute, rigid with thick scarious margins and apices, scarious apices ± 0.6 mm long. Disc florets 3–18, sometimes with resin canals in the tube, limb and lobes; corolla 2.3–2.6 mm long, with only glandular trichomes, yellow; tube 1.0–1.5 mm long; limb campanulate, 0.8–1.2 mm long (excluding lobes); lobes spreading, 0.6–0.7 mm long, triangular. Anthers 2.5–2.8 mm long (including apical appendage); apical appendage oblong. Style 2.0–2.8 mm long (excluding branches); branches 0.5–0.6 mm long. Cypselas ca. 2.0 × 0.5 mm, oblong, 13– to 14- ribbed, apical rim thickened, entire to slightly dentate, light to dark brown, glandular trichomes absent, discontinuous resin canals in ribs present. Figure 20.

**DIAGNOSTIC CHARACTERS**—*Phymaspermum acerosum* shares the narrowly lobed pinnatifid leaves, the absence of myxogenic trichomes on the cypselas and the presence of prominent resin canals in the cypselas ribs with *P. pinnatifidum*. It can be distinguished by its narrowly campanulate to oblanceolate involucres and the absence of a prominent apical crown on the cypselas (only at most a thickened apical rim which can be entire to shortly dentate). *Phymaspermum acerosum* is also a much larger more robust shrub growing to more than 0.5 m tall with much thicker and woodier stems than the smaller *P. pinnatifidum* which tends to have much more slender and herbaceous stems.

The previously recognised species *P. villosa* was at first distinguished from *P. acerosum* by having much broader oblong and hairy involucres. *Phymaspermum acerosum* was considered to only have narrowly campanulate involucres however, after many specimens were examined, *P. acerosum* is now considered to have involucres which vary from narrowly campanulate to broad and oblong and *P. villosa* is now a synonym of *P. acerosum*.

**DISTRIBUTION AND ECOLOGY**—*Phymaspermum acerosum* is widely distributed from Port Elizabeth in the Eastern Cape Province to Noodsberg in the Limpopo Province (Fig. 20 F) where it occurs in grassland and forest margins at an altitude
of 60–2,200 m. It flowers throughout the year, with a peak between April and July.

Additional Specimens Examined—SOUTH AFRICA. Gauteng: 2528 (City of Tshwane): Doornpoort (−CB), Mogg 2161 (PRE). Mpumalanga: 2430 (Pilgrims Rest): Ohrigstad Nature Reserve (−DC), Theron 3633 (PRE), Theron 3607 (PRE), Jacobsen 2903 (PRE); Morogzon Nature Reserve, near Graskop (−DC), Reid 3 (PRE); Mount Sheba Nature Reserve (−DC), Kerf 8577 (PRE); near Graskop (−DD), Phillips 3491 (PRE); Graskop, above Kowyre Pass, along road (−DD), Koekemoer 2123 (PRE), near Mac-Mac Falls (−DD), Burtt Darby 438 (PRE, BOL), 2530 (Masishing): 8 miles from Pilgrims Rest on Mashishing road (−AB), Story 1215 (PRE); Mashishing (−AB), Burtt Darby 1165 (BOL), Wilms 791 (BM-image, WILIS), 790 (BM-image, N); Mashishing, near turn off to Mount Anderson from Long Tom Pass (−BA), Koekemoer 2280 (PRE); Pilgrims Rest, between Mashishing and Sabie (−BA), Schiff 5465 (PRE); Between Mashishing and Sabie (−BA), Pole Evans 2995 (PRE); Hartbeesvlok (−BA), Mohle 20 (PRE); Sabie valley (−BB), Galpin 39 (BOL); Rosehaugh (−BD), Rogers 20377 (PRE), Sim 546 (BOL); Entokozwini (−CB), Young 1476 (PRE); Emakhazeni near Entokozwini (−CA), Cold 7759 (PRE); Helopsmith, Kaapse Hoop road, 12 miles out (−DB), Liebenberg 2553 (PRE), 2531 (Komatiport: Barberton (−CC), Williams 10512 (PRE), 7 miles NW of Havelock Mine, Barberton (−CC), Cold 7846 (PRE). 2730 (Vryheid): Hoedjie, Farm Suikerhok, Wakkerstroom (−AB), Devenish 1698 (NU). Around Robertson to our attention and the landowner, Mr. Ernst Bruwer, making specimens available on loan. Mr. Nick Helme is thanked for

Acknowledgments. The curators and staff of the cited herbaria are thanked for their kind hospitality and assistance during visits and for making specimens available on loan. Mr. Nick Helme is thanked for bringing his collection of what turned out to be a new species from around Robertson to our attention and the landowner, Mr. Ernst Bruwer, for allowing us to collect type material and study the plant in situ. Dr. Anne-Lise Scute-Vlوك and Mr. Jan Vlok are thanked for supplying us with material and images of P. aphyllum. Dr. Laurent Gautier and herbarium staff from Conservatoire Botanique de la Ville de Genève are thanked for supplying electronic images of type material. Cape Nature, the Eastern Cape Department of Economic Development, Environmental Affairs and Tourism, and Ezemvelo KZN Wildlife are thanked for providing the relevant permits.

APPENDIX 1. Morphological characters and character states used in the cladistic analysis. 1, Habit: single-stemmed = 0; multistemmed = 1. 2, Leaves: erect to spreading = 0; appressed = 1. 3, Capitula: peduncles undivided to lax corymb = 0; arranged in dense corymb = 1. 4, Capitula paleae: present = 0; only marginal = 1. 5, Involucral bracts: rigid = 0; scarios = 1. 6, Ray florets: absent = 0; present = 1. 7, Cypselas: width ≤ 0.8 mm = 0; width > 0.8 mm = 1. 8, Cypselas: < 10 = 0; > 10 = 1. 9, Cypselas surface: not papillose = 0; papillose = 1. 10, Glandular trichomes: absent = 0; present = 1. 11, Glandular trichomes distribution: dense = 0; sparse = 1. 12, Resin canals in ribs: present = 0; absent = 1.
