BioOne Complete (complete.BioOne.org) is a full-text database of 200 subscribed and open-access titles in the biological, ecological, and environmental sciences published by nonprofit societies, associations, museums, institutions, and presses.

Your use of this PDF, the BioOne Complete website, and all posted and associated content indicates your acceptance of BioOne's Terms of Use, available at <u>www.bioone.org/terms-of-use</u>.

Usage of BioOne Complete content is strictly limited to personal, educational, and non - commercial use. Commercial inquiries or rights and permissions requests should be directed to the individual publisher as copyright holder.

BioOne sees sustainable scholarly publishing as an inherently collaborative enterprise connecting authors, nonprofit publishers, academic institutions, research libraries, and research funders in the common goal of maximizing access to critical research.

Instructions for preparing a manuscript for *BioScience* can be found at *www.aibs.org/bioscience/resources/ Info_for_contribs.pdf*.

Advertising: For information on both display and line classified advertisements and deadlines, contact John Rasanen, American Geological Institute; telephone: 703-379-2480, ext. 224; fax: 703-379-7563; e-mail: jrasanen@aibs.org. BioScience (ISSN 0006-3568) is published monthly except July/August combined by the American Institute of Biological Sciences. To subscribe, call 1-800-992-2427, ext. 29. Individual membership: sustaining, \$90/yr; individual, \$70/yr; family, \$90/yr (includes \$36 for BioScience); emeritus, \$50/yr; K-12 teacher/administrator, \$45/yr (includes \$22 for BioScience); graduate and postdoctoral students, \$40/yr (includes \$21 for BioScience); undergraduate and K-12 students, \$20/yr (includes \$15 for BioScience); lifetime, \$1400 (one-time fee). Institutional subscriptions: domestic, \$337/yr; foreign, \$404/yr. Single copies: \$14 plus shipping and handling for up to 20 copies; volume discounts available for more than 20 (call 1-800-992-2427, ext. 29). Subscription renewal month is shown in the four-digit year-month code in the upper right corner of the mailing label.

Science's Greatest Challenge

The pace of progress in biological science, as in science generally, is staggering. As a young faculty member in the 1970s, I could not have conceived that we would soon have in hand the complete sequence of even a viral genome, much less a human's. The same holds for science's applications. We have seen the emergence of a deadly plague caused by a class of viruses that was unknown when I was a student, yet we have been able to describe the agent and develop effective therapies within little more than a decade. Progress has been so great that it is taken for granted, and even breeds a widespread complacency: Don't worry about the future, technology will solve our problems.

So it is that science is welcome, under the guise of technology. We are a pragmatic people, and we appreciate what works to our benefit, as long as it is fairly immediate (and preferably economic). Many will learn enough technology to wire their stereo system, but few will learn how scientists discovered the principles that make the system possible. And how many people realize that the technology they depend on exists by virtue of scientific theories—real, trustworthy knowledge of fundamental regularities in physics, chemistry, biology, and other sciences?

For even as people appreciate technology, they widely distrust science, as is clear when scientists challenge beliefs or speak "an inconvenient truth" (as Al Gore puts it). Among contemporary issues, evolution, global climate change, and the disastrous effects of unchecked population growth are the most conspicuous examples. More than half of Americans do not accept the most important unifying principle in the life sciences; politicians disparage a virtually unanimous scientific consensus on climate change; and the religious right ensures that even contraception is a politically risky topic. Some scientific consensus is more trustworthy than the pronouncements of an industry-sponsored naysayer or a president untrained in biology or physics?

The biggest challenge to biology and to science is not to achieve deeper understanding of genomes or ecosystems or black holes—that understanding is coming along just fine. The challenge that matters now is to make sure that science is taken seriously. Scientists need to convince people that we have developed honest procedures for understanding how the world works, that we can put confidence limits around most of our conclusions, and that our track record shows we have achieved reliable, if still incomplete, knowledge.

In this connection, as AIBS past-president Kent Holsinger described in his December 2006 editorial, AIBS will work with the National Academy of Sciences to make 2009 the "Year of Public Understanding of Science." Meanwhile, many of us can make our own contributions, by teaching students how science works. It is only through education that we can hope for a scientifically literate population. Is it too much to say that the future of the world depends on it?

DOUGLAS J. FUTUYMA President, AIBS
