BioOne Complete (complete.BioOne.org) is a full-text database of 200 subscribed and open-access titles in the biological, ecological, and environmental sciences published by nonprofit societies, associations, museums, institutions, and presses.

Your use of this PDF, the BioOne Complete website, and all posted and associated content indicates your acceptance of BioOne's Terms of Use, available at www.bioone.org/terms-o-use.

Usage of BioOne Complete content is strictly limited to personal, educational, and non-commercial use. Commercial inquiries or rights and permissions requests should be directed to the individual publisher as copyright holder.

BioOne sees sustainable scholarly publishing as an inherently collaborative enterprise connecting authors, nonprofit publishers, academic institutions, research libraries, and research funders in the common goal of maximizing access to critical research.
First record of *Heliothrips haemorrhoidalis* (Thysanoptera: Thripidae) causing damage on greenhouse strawberries

Mireli Trombin de Souza¹,²,*, Michele Trombin de Souza¹,², Launa Bianca Dybas Ivankio¹, Bruna Caroline Durau¹, Leticia Tamara Maleski¹, and Maria Aparecida Cassilha Zawadneak¹,²

Characteristic silvery patches made by thrips (Thysanoptera) were observed on leaves of semi-hydroponic greenhouse strawberries (*Fragaria x ananassa* Duch.; Rosaceae) ‘Camino Real’ cultivar, in Curitiba, Paraná, Brazil (25.428888°S; 49.267500°W), in Sep 2017. Forty-nine adult insects were collected and preserved in AGA solution (1:1:10 parts of glycerin, glacial acetic acid, and ethyl alcohol 60%, respectively). Specimens were slide-mounted (Mound & Kibby 1998) and identified as the greenhouse thrips, *Heliothrips haemorrhoidalis* (Bouché) (Thysanoptera: Thripidae), based on specialized taxonomic keys (Mound & Marulo 1998; Nakahara et al. 2015).

All specimens obtained were females (Fig. 1a), with strongly reticulated head sculpture (Fig. 1b); 8-segmented antennae, antennal segments III–V and VII–VIII yellow, VI brown in apical half (Fig. 1c); pronotum polygonally reticulate, without long setae; metanotum with a bold and reticulate triangle, median setae short (Fig. 1d); tergites III–IV strongly reticulate, the median setae long and close to each other (Fig. 1e); wings hyaline, with round apex; and yellowish legs (Fig. 1f). The body color presented variation according to the life stage: recently emerged individuals had the head and thorax dark brown and the abdomen light brown (Fig. 2a), whereas in mature females the abdomen was dark brown, except by the paler tergites III–IV strongly reticulated, the median setae long and close to each other (Fig. 1e); wings hyaline, with round apex; and yellowish legs (Fig. 1f).

*Heliothrips haemorrhoidalis* is native from South America, and it is known as highly polyphagous on the leaves of several unrelated plants. It has been reported on several crops, including coffee (*Coffea arabica* L.; Rubiaceae), orange (*Citrus aurantium* L.; Rutaceae), passionfruit (*Passiflora edulis* Fresco; Passifloraceae) (Suris & González 2008), lime (*Citrus aurantifolia* (Christm.) Swingle; Rutaceae), rose (*Rosa sp.* L.; Rosaceae), wild strawberry (*Fragaria vesca* L.; Rosaceae) (Etienne et al. 2015), and avocado (*Persea americana* Mill.; Lauraceae) (Larral et al. 2018). A greenhouse bioassay was conducted to confirm the damage caused by *H. haemorrhoidalis* in strawberries. Damage characterization was conducted with cage-confined individuals following the methodology described by Non-dillo et al. (2010). Each cage was set up with 1 leaf or 1 semi-ripe strawberry fruit, free from arthropod-induced damage, resulting in a total of 20 replicates for each plant part. Larvae (*n* = 10) and adults (*n* = 10) were placed in each cage using a fine paintbrush and kept confined for 72 h. A control was set up with an insect-free cage. Feeding damage was found on leaves and sepals. Thrips are piercing-sucking feeders, piercing the plant surface to feed on chlorophyll and other cell contents from plant tissue (Chhagan & Stevens 2007). As a consequence, silver-colored areas and black spots, due to deposition of excrement, appeared around feeding areas (Fig. 2c). Feces may act as a protective barrier against natural enemies (Denmark & Fasulo 2010) since, after oviposition, *H. haemorrhoidalis* were observed depositing excrement over the eggs.

*Hyalidocoris insignis* (Stål) (Heteroptera: Miridae) and *Orius insidiosus* (Say) (Hemiptera: Anthocoridae) were observed preying on *H. haemorrhoidalis* adults and immatures, including larvae, prepupa, and pupae (Fig. 2a, b, f, g, and h). This is the first record of *H. insignis* preying *H. haemorrhoidalis*. So far, biological control studies have indicated approximately 10 natural enemies of the greenhouse thrips (CABI 2018). However, a parasitoid, *Thripobius semiluteus* Boucek (Hymenoptera: Eulophidae), has been considered the most efficient natural enemy for the control of *H. haemorrhoidalis* (McMurtry 1992; Bernardo et al. 2005; CABI 2018).

Vouchers specimens were deposited in the Padre Jesus Moure Museum, Federal University of Paraná, Curitiba, Brazil: *H. haemorrhoidalis* (DZUP 519163), *H. insignis* (DZUP 490170), and *O. insidiosus* (DZUP 490169).

This is the first report of *H. haemorrhoidalis* causing damage on strawberry crops in the world. Observations of beneficial agents naturally controlling *H. haemorrhoidalis* populations may provide new perspectives for future biocontrol programs for managing this species.

We thank the Coordination for the Improvement of the Higher Level Personnel (CAPES), National Council for Scientific and Technological Development (CNPq), for the financial support; we are grateful to Paulo Fiua Ferreira (Federal University of Viçosa) and the German Rosado Neto (Federal University of Paraná) for identification of *Hyalidocoris insignis* and *Orius insidiosus*, respectively. We also thank BioAgro for providing the seedlings used in experiment.

**Summary**

*Heliothrips haemorrhoidalis* (Bouché, 1833) (Thysanoptera: Thripidae), the greenhouse thrips, is reported here for the first time damaging strawberry leaves and sepals (*Fragaria × ananassa* Duch.; Rosaceae) in the world. Two natural enemies were observed preying on the species: *Hyaliodocoris insignis* (Stål, 1860) (Heteroptera: Miridae) and *Orius insidiosus* (Say, 1832) (Hemiptera: Anthocoridae).

Key Words: *Fragaria × ananassa*; greenhouse thrips; leaf damage; natural enemies

**Fig. 1.** Morphological characteristics of *Heliothrips haemorrhoidalis*: (a) female, (b) head and pronotum reticulated, (c) antennae, (d) mesonotum, metanotum, and tergite I–II reticulated, (e) tergites III–VI, and (f) forewing and leg.

**Sumário**

*Heliothrips haemorrhoidalis* (Bouché, 1833) (Thysanoptera: Thripidae), o tripes-das-casas-de-vegetação, é relatado pela primeira vez danificando folhas e sépalas de morangueiro (*Fragaria × ananassa*) em todo o mundo. Dois predadores naturais foram observados preying no gênero: *Hyaliodocoris insignis* (Stål, 1860) (Heteroptera: Miridae) e *Orius insidiosus* (Say, 1832) (Hemiptera: Anthocoridae).

Key Words: *Fragaria × ananassa*; tripes-das-casas-de-vegetação; danos em folhas e sépalas; predadores naturais
Duch.; Rosaceae) no mundo. Dois inimigos naturais foram observados predando a espécie: *Hyaliddocoris insignis* (Stål, 1860) (Heteroptera: Miridae) e *Orius insidiosus* (Say, 1832) (Hemiptera: Anthocoridae).

Palavras Chave: *Fragaria × ananassa*; tripes-das-casas de vegetação; dano foliar; inimigos naturais

**Fig. 2.** *Heliothrips haemorrhoidalis* and its damage in strawberry plants: (a) teneral female, (b) mature female, (c) egg, (d) damage on leaves, (e) leaf chlorosis and fecal specks, (f) larva, (g) pre-pupa, and (h) pupa.
