landscape that offers adequate resources and allows GHLTs to move and breed successfully within the exceptionally heterogeneous environment of southern Bahia. Partly, this includes a much better understanding of the anthropogenic pressures on GHLTs and their habitat. Of equal importance is the consideration of GHLTs within their broader ecological network and the Atlantic Forest ecosystem. Studying GHLTs as an integral part of the ecological network of which they are a part will improve our understanding of the species’ needs as well as its role within the ecosystem, contributing to more efficient conservation actions in the long-term. To get to this point, critical research is still needed at both broader and narrower scales as described in this document. Broadening our focus to the entire Atlantic Forest while continuing to study essential aspects of the species’ biology, is likely the most efficient conservation strategy over the long-term. There is an increasing demand for large-scale projects that focus on regions, their ecological functionality, and the species within those regions. We hope that this document serves as a guideline for how to develop new projects and partnerships that incorporate this demand and contribute to the long-term persistence of GHLTs and the Atlantic Forest.

Acknowledgments

This symposium was made possible with financial and structural support of the Centre for Research and Conservation of the Royal Zoological Society of Antwerp and logistical support from UESC. We thank Paula Reis and Juliana Monteiro for note-taking during the symposium, and Deborah Faria, Vanessa Nogueira, and Josinei da Silva Santos for advertising and logistical support. Funding to the CRC is provided by the Flemish Ministry of Economy, Science and Innovation (Belgium).
