BioOne Complete (complete.BioOne.org) is a full-text database of 200 subscribed and open-access titles in the biological, ecological, and environmental sciences published by nonprofit societies, associations, museums, institutions, and presses.

Your use of this PDF, the BioOne Complete website, and all posted and associated content indicates your acceptance of BioOne's Terms of Use, available at www.bioone.org/terms-of-use.

Usage of BioOne Complete content is strictly limited to personal, educational, and non - commercial use. Commercial inquiries or rights and permissions requests should be directed to the individual publisher as copyright holder.

BioOne sees sustainable scholarly publishing as an inherently collaborative enterprise connecting authors, nonprofit publishers, academic institutions, research libraries, and research funders in the common goal of maximizing access to critical research.

Editorial

The present issue is the first Symposium Proceedings published in *Wildlife Biology*. Due to the applied character of their science, game and wildlife biologists organise scientific meetings on special and relatively restricted topics. These 'gatherings' summarise the most recent knowledge, and produce syntheses of importance to most administrators, managers and different wildlife organisations.

I feel convinced that this issue, dealing with introduced wildlife, will be received with applause as this is still a hot topic in many countries all over the world. I will take the opportunity to thank the organisers for the good results obtained at the workshop, and my special thanks go

to Dr. Petri Nummi, who was the Special Editor of this issue.

The articles of this issue were subjected to the usual refereeing procedures of *WILDLIFE BIOLOGY*. Although we may be publishing proceedings also in the future, we will not allow them to 'disturb' the publication of other scientific articles. But one issue per year might be devoted to proceedings presented at scientific meetings.

Harto Lindén
Editor-in-Chief

Preface

This special issue evolved from the OECD workshop "Ecology of introduced, exotic wildlife: Fundamental and economic aspects", held on April 22-26, 1996 in Ammarnäs, Sweden. The workshop was jointly organised by the Swedish University of Agricultural Sciences, Department of Animal Ecology, Umeå (Sweden), and the University of Helsinki, Department of Applied Zoology, Helsinki (Finland), in co-operation with the Organisation for Economic Co-operation and Development (OECD).

The OECD Co-operative Research Programme

Within the OECD, a co-operative research programme for "Biological Resource Management" has focused since 1990 on four specific topic areas, one of which is "Ecology and utilisation of new organisms" (Theme 3). The activities promoted by this programme are post-doctoral fellowships (announced annually), and the organisation of workshops (1-2 workshops per Theme per year). The 24 participating OECD member countries in this programme are: Australia, Austria, Belgium, Canada, Czech Republic, Denmark, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Japan, the Netherlands, New Zealand, Norway, Portugal, Spain, Sweden, Switzerland, Turkey, the UK, and the USA.

Examples of the items included in Theme 3 of the programme include:

- The introduction of new organisms and transgenic crop plants
- Insect and weed biocontrol with new organisms
- Population biology of new organisms in agricultural systems
- Biodiversity and ecological consequence assessment
- The sustainability of agricultural systems using new organisms
- Mathematical modelling of new organism introductions.

Previous recent workshops, organised within Theme 3 and funded by the OECD Programme, include:

- Introduction of non-endemic nematodes for biological control: scientific and regulatory policy issues (proceedings by Ehlers & Deacon, 1996)
- Transgenic crop plants: agronomic, economic and ecological aspects (proceedings by Hokkanen & Tsafaris, 1996)
- Benefits and risks of introducing biological control agents (proceedings by Hokkanen & Lynch, 1995)
- Ecological implications of transgenic crop plants containing *Bacillus thuringiensis* toxin genes (proceedings by Hokkanen & Deacon, 1994)

For further information about the OECD Programme please contact professor Heikki Hokkanen, Head of Pro-

gramme (as of 1.1.1997), Directorate for Food, Agriculture and Fisheries, OECD, 2 rue André-Pascal, F-75775 Paris Cedex 16, France.

The workshop on introduced, exotic wildlife

The aim of this workshop was to review, analyse and discuss the existing collective experience and available information on the benefits, hazards, and management of exotic wildlife. In total, 18 scientists from 9 different OECD countries were invited to participate in the workshop, which was held at the new Ammarnäs research station in Swedish Lapland. The scientific program involved contributed paper presentations (with discussions), and structured discussion sessions around the most critical topics. On the last day, the conclusions and recommendations from the workshop were discussed, prepared, and reviewed. These are printed as the first paper of this issue. Together with the conclusions and recommendations from several previous OECD workshops (e.g. on Bt-transgenic crops, nematodes for biological control), they form a set of expert guidelines that can be used by regulators in OECD and other countries in making decisions about introductions of exotic or modified living organisms.

It is evident that the predictiveness of invasion ecology is still quite limited (e.g. Kareiva 1996). Therefore case studies from different kinds of habitats are particularly interesting. In this special issue we have a good representation of two geographical areas, rarely or not at all covered in recent books about invasion ecology (e.g. Mooney & Drake 1986, Drake et al. 1989). These are the species-poor northern Europe, as well as Australia and New Zealand. Especially the case studies on New Zealand are very important because it has experienced a heavy invasion of new mammal and bird species, and it originally had a very depauperate fauna of terrestrial mammals.

Recent reviews on the subject area have seldom addressed topics treated in this issue. These include, besides

the specific regional aspects, the severe conservation problems caused by hybridisation between indigenous and exotic species, the pest problems caused by invading and exotic wildlife, and the management (rather than purely ecological) questions of established new species.

These and other papers in this issue are expected to help in developing scientifically sound procedures for responsible utilisation of exotic wildlife, as well as in the management of accidentally released and established populations of exotic vertebrates.

For the success of this workshop we sincerely thank the superb organisation and the supporting personnel in Ammarnäs, Umeå, Helsinki, and Paris.
