BioOne Complete (complete.BioOne.org) is a full-text database of 200 subscribed and open-access titles in the biological, ecological, and environmental sciences published by nonprofit societies, associations, museums, institutions, and presses.

Your use of this PDF, the BioOne Complete website, and all posted and associated content indicates your acceptance of BioOne's Terms of Use, available at www.bioone.org/terms-of-use.

Usage of BioOne Complete content is strictly limited to personal, educational, and non - commercial use. Commercial inquiries or rights and permissions requests should be directed to the individual publisher as copyright holder.

BioOne sees sustainable scholarly publishing as an inherently collaborative enterprise connecting authors, nonprofit publishers, academic institutions, research libraries, and research funders in the common goal of maximizing access to critical research.

LETTER TO THE EDITOR . . .

On the Use of Succinylcholine in Elk

We are writing in response to information given in the article: "Efficacy of Triclanbendazole Against Natural Infections of *Fascioloides magna* in Wapiti" in *Journal of Wildlife Diseases* 27(4)1991, pp. 599-605.

Starting on page 599 it is stated that 14 adult wapiti were immobilized solely with succinylcholine chloride and subsequently antlers were removed in the males with no additional analgesia or anesthesia provided. Due to the strictly paralytic nature of succinylcholine chloride we feel the elk were subjected to an unacceptable level of

pain and stress. Cost and ease of use do not preclude the humane treatment of animals, especially when alternative means are available, such as the xylazine later listed in the study.

Publication of the above article, although providing valuable scientific information, condones an unacceptable protocol which we believe is not in the best interests of the journal or the organization.
