BioOne sees sustainable scholarly publishing as an inherently collaborative enterprise connecting authors, nonprofit publishers, academic institutions, research libraries, and research funders in the common goal of maximizing access to critical research.

in each layer of ice represent tiny samples of the Earth's ancient atmosphere. Through painstaking analysis, the history of atmospheric composition can be reconstructed—decade upon decade, century by century, millennium after millennium. In this way, we can accurately assess the long-term changes in the concentrations of greenhouse gases such as carbon dioxide and methane. This is vital information for climate models, and it cannot be obtained in any other way.

Fish biologist Art DeVries has been researching how fish living near the shores of Antarctica keep themselves alive in subfreezing waters. He began his fieldwork in Antarctica in 1961, and he and his team of researchers have now discovered how these fish make antifreeze compounds in their bodies and how the compounds isolate and essentially neutralize the inevitable ice crystals—both those that are ingested from the icy waters and those that form inside fish's body cavities. It has been a long, hard struggle, but 50 years of research by DeVries and his colleagues has produced invaluable discoveries about fish physiology and biochemistry.

*Secrets of the Ice* is richly illustrated with color photographs of Antarctic landscapes, wildlife, and the scientists at work in the field and laboratory. I highly recommend it to readers interested in cold-regions research.
