

## Supplemental material for

“Experience with a hard and soft participatory modeling framework for social-ecological system management in Mt Everest (Nepal) and K2 (Pakistan) protected areas”, by F Salerno, E Cuccillato, P Caroli, B Bajracharya, EC Manfredi, G Viviano, S Thakuri, B Flury, M Basani, D Panzeri; published in *Mountain Research and Development* (MRD) vol 30 no 2 (May 2010)

**Table S1. Main guidelines adopted for the formalization of cognitive maps.**

GENERAL RULES			
<i>Model versions</i>	The different versions of maps produced during this phase need to be stored and catalogued following rules that allow documentation of the evolution of the cognitive process. For instance we suggest: <i>[model name][version][yy][mm][dd] [author initials]</i> .		
<i>Model components</i>	The quantitative model is composed of one or more maps, including the relevant documentation according to the protocol. The documentation includes the following sections:		
	<b>Section</b>	<b>Description</b>	
	<i>Aims</i>	General and specific aims of the model	
	<i>Narrative description</i>	Textual explanation of the concept map	
	<i>Time step</i>	The time step over which the system changes	
	<i>Spatial disaggregation</i>	How space should be represented	
	<i>Links to other models</i>	Information coming from or going to other models	
	<i>Assumptions</i>	Description of what is taken for granted	
	<i>Management levers</i>	Variables available for a manager to change or influence the system towards desired outcomes	
	<i>Data requirements</i>	Data required to describe concepts and relationships among them	
	<i>Management-oriented research</i>	Description of research requirements emerging from the process	
<i>Flow of information</i>	Maps should show the flow of information from inputs to management outcomes. However, it is essential that feedback interactions are also captured and highlighted. For instance we suggest: maps follow a vertical frame.		
<i>Data requirement</i>	The documentation of the last formal version of the conceptual contains data required for the subsequent quantitative translation.		
RULES FOR DIAGRAMMING			
<i>Concepts</i>	Each node of the map represents a concept (an idea) of the modeled system. In the standardization process, each concept on the map is associated with the relevant type:		
	<b>Concept type</b>	<b>Color</b>	
	<i>Input data</i>	Yellow	
	<i>Intermediate variables</i>	Pink	
	<i>Connection to other submodels</i>	Orange	
	<i>Indicators of performance</i>	Green	
	<i>Policy levers</i>	Blue	
	<i>Economic aspects regarding policy</i>	Red	
	<i>Space and time disaggregation</i>	Grey	
<i>Relationship type</i>	The nodes are connected with connectors (arrows, arcs) provided with labels indicating a linking phrase:		
	<b>Relationship</b>	<b>Linking phrases</b>	<b>Description</b>
	<i>Causal</i>	+, -, +/-	Used to describe positive, negative relationships or when they can be either positive and negative depending on specific conditions.
	<i>Spatial</i>	<i>through, near, within, is-next-to, from, to</i>	Used to describe spatial relationships. Example: tourists go through valleys.
	<i>Time</i>	<i>before, after, during, delays</i>	Used to describe temporal relationships. Example: birds migrate during winter.
	<i>Action</i>	<i>creates, destroys</i>	Used to describe relationships of population dynamics. Example: tigers predate deer. In this case, predate is used as a synonym for destroy.
	<i>Undefined</i>	<i>influence</i>	Used to describe relationships that are known but cannot be described according to the linking phrases available. This is a generic type of relationship and should be used only when all the other options available have been checked and discarded.
	<i>Unknown</i>	?	Used to describe relationship of unknown nature. The narrative description must be provided as text. The use of “unknown” relationship should be as limited as possible.
