

## Supplemental material for

“A Nationally Coherent Characterization and Quantification of Mountain Systems in Canada”, by Graham McDowell and Jiaao Guo, published in *Mountain Research and Development* 41(2), 2021. (See <https://bioone.org/toc/mred/41/2>)

**APPENDIX S1** Elaboration of analysis methods (in ArcGIS) for each research question.

### How much of Canada is covered by mountainous terrain?

- Canada’s official boundary:
  1. Clip Statistics Canada’s national boundary (provinces/territories) file by the world K1 mountain boundaries
  2. Calculate percentage of Canada’s K1 mountains area / total national terrestrial area.
- Global comparison using Word Bank’s [world administrative country](#) file:
  1. Clip the World Bank’s administrative country boundaries (under *Sovereign country* and *country* class, excluding those dispute areas) by global K1 mountain layer.
  2. "Union" the K1 mountain polygon with the world country polygon (to get the K1 mountain segmented by each country's boundary).
  3. Clip the union file again by the K1 mountain boundary.
  4. Calculate the "area" geometry of each K1 mountain polygon in the corresponding country.
  5. Use "Feature to Point" tool to convert the file in step 4 into points (“inside” feature)
  6. Using "Spatial Join" (sum) tool to get the total K1 mountain area in km<sup>2</sup> per country.
  7. Calculate the percentage of K1 mountain areas/total land areas

### What are the major mountainous regions of Canada?

1. Defining 10 major mountain classes inspired by Canada’s Terrestrial Ecozones: Atlantic Maritime; Arctic Cordillera; Boreal Cordillera; Interior Hill North; Interior Hill West; Interior Hill Central; Montane Cordillera; Pacific Maritime; Taiga Cordillera; and Taiga Shield.
  - Major mountain classes are customized and may not strictly lined up with ecozones.
  - Note that Interior Hill West includes those sparsely distributed K1 mountains within Taiga Plains and Boreal Plains ecozones; Interior Hill North includes those sparsely distributed K1 mountains within Northern Arctic and Southern Arctic ecozones; and Interior Hill Central includes those K1 mountains in southern part of Boreal Shield and Taiga Shield ecozones.
2. Extract 10 pre-defined classes by Canadian K1 mountain boundaries.
3. Calculate area geometry of each major mountain classes.
4. Calculate their area percentage of total Canadian K1 mountain areas.

### **What land-cover types found in Canada's mountain areas?**

1. Extract Government of Canada's 2015 Land Cover of Canada by mask (K1 mountains)
2. Get the cell count of the 15 classes of extracted land cover types
3. Calculate percentage of each land cover class divided by total land cover cell-count of Canada & K1 mountains
4. Repeat the process based on major mountain classes.

### **To what extent are Canada's protected and conserved areas associated with mountains?**

1. Clip the Canadian Protected and Conserved Areas Database (CPCAD) layer by K1 mountain boundaries.
2. Calculate area geometry of CPCAD within K1 mountains and the subsets (e.g. National Park).
3. Calculate percentage of CPCAD and subsets by major mountain classes.

### **How many people live within and adjacent to mountain areas in Canada?**

- By Statistics Canada's 2016 Dissemination Block (DB):
  1. Define selection logic: including all the DBs that have at least 50% areas within K1 mountain boundaries
  2. Select the DB data that intersected with K1 polylines (e.g. K1 mountains' outer boundaries), exported into a new DB polygon (file A). Calculate the area (in Km<sup>2</sup>) of each of the new DB file.
  3. Clip the new DB file A by original the K1 polygon, to get file B. Calculate the remaining area of file B.
  4. Calculate the area percentages of file B/file A; re-select those polygons with over 50% in K1 mountains and exported as file C.
  5. Select the DB polygons that are completely within the K1 mountains, exported as file D.
  6. Merge file C and file D to get the complete DBs that have at least 50% areas covered by K1 mountains.
- For Indigenous populations by Aboriginal Identity at the Census Subdivision (CSD) level:
  1. Clean up the Aboriginal Identity Table to only count for the "GEO\_LEVEL " = 3, "DIM: Sex (3)" = "Total - sex ", "DIM: Age (20) " = "Total - Age ", "DIM: Registered or Treaty Indian status (3)" = "Total - Population by Registered or Treaty Indian status "
  2. Define selection logic: A). including all the CSDs that have at least 50% areas within K1 mountain boundaries; and B). all CSDs touching the K1 mountains, and have minimum Indigenous inhabitants of 500
  3. Repeat selecting method as the DB part, plus adding those CSDs with overall 500 Indigenous inhabitants.

- By World Gridded Population (2020):
  1. Clip gridded population raster by Canada's national boundary, and K1 mountain boundaries of Canada, respectively.
  2. Get the cell count and average cell value of national population grid and K1 mountain population grid; calculate the K1 mountain population / national population percentage
  3. Generate 100Km buffer from K1 mountain boundaries; repeat the above steps to calculate the K1 mountain population of 100Km buffer / national population.

### **Which Indigenous territories intersect with mountain areas in Canada?**

1. Download "Territories" datasets (.json) from native-land.ca and convert them into shapefiles.
2. Select territories that are intersect with K1 mountain boundaries as Layer A; clip territories data by K1 mountain boundaries as Layer B.
3. Calculate the K1 percentages of those mountainous Indigenous territories (B/A percentage)

### **Which Indigenous linguistic areas intersect with mountain areas in Canada?**

1. Download "Language" datasets (.json) from native-land.ca and convert them into shapefiles.
2. Clip territories data by K1 mountain boundaries; display on map with labels

### **What proportion of Canada's GDP originates from economic activity in Canada's mountain areas?**

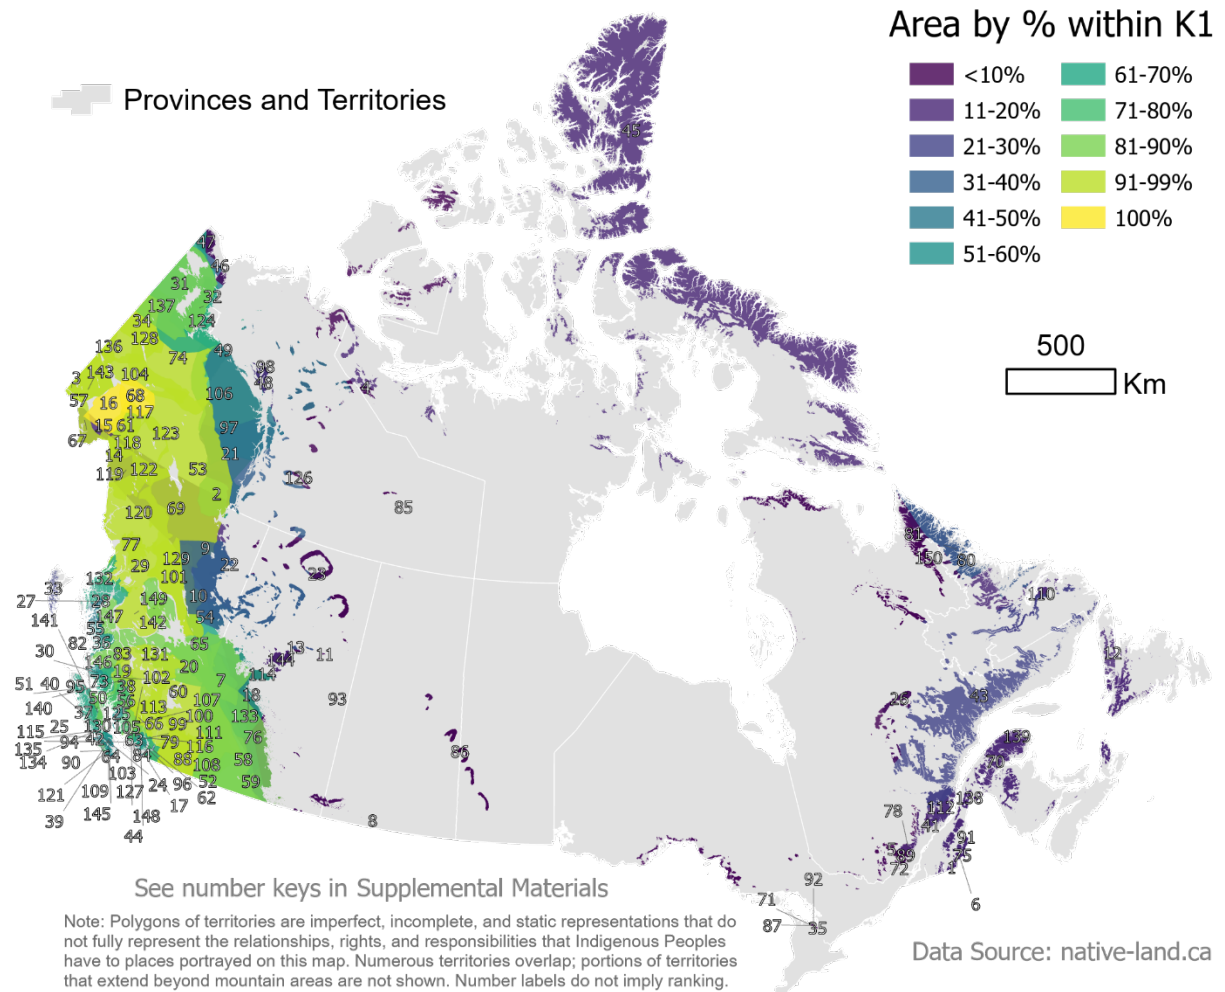

1. Linear transformation logic: Canada's 2010 and 2019 gross domestic product, current prices, by "Purchasing power parity; international dollars", were 1,353.06 and 1,925.58 billion, respectively. The equivalent GDP (PPP) growth would be +42.3%
2. Clip World Bank's 2010 gridded GDP raster by Canada's national boundary, and K1 mountain boundaries of Canada, respectively.
3. Using "raster calculator", multiplies the GDP value for Canada and K1 mountain by 1.423 (to match with IMF's growth rate from 2010 to 2019)
4. Get the cell count and average cell value of national GDP grid and K1 mountain GDP grid.
5. Calculate the K1 mountain GDP / national GDP percentage

### **What are the main economic sectors in Canada's mountain areas?**

- N/A

All maps based on these analyses use datum and projections information of NAD83 Canada Atlas Lambert. Its [European Petroleum Survey Group](#) (ESPG) code is 3978.
