

Appendix S3. Relationship between mean lumen area and climatic variables (temperature and precipitation) during 2010–2012 (see Table 1 for explanation of site and species codes). Earlywood (laEW) values were plotted against spring (April–June) mean air temperature and total precipitation. Latewood (laLW) values were plotted against summer (July–September) mean air temperature and total precipitation. Axes are in logarithmic scale; curved lines show linear regressions on non-linear axes. Adjusted R^2 and P values are reported only for relationships with $R^2_{adj} \geq 0.15$.
